

Contents

1	Population Changes: Impact and Patterns	1
	Economic impact of population changes. Political and social impact of population changes. An introductory profile of the transition. General characteristics of the demographic transition. Fertility behavior 1950–80. A set of general hypotheses. Format of the study.	
2	An Overview	21
	Introduction. Behavioral assumptions. Time constraints and fertility. Family time (income) sharing and security of lifestyles. Living standard norms. Summary. The model's approach: a preview.	
3	Lifestyles and Family Fertility Behavior	47
	The living standard norm in historical perspective. Behavioral assumptions: the role of the extended family. Empirical support of living standard threshold. Economics of fertility and the secular pattern of time use.	
4	Economic Modeling of Fertility	68
	The Chicago–Columbia theory of fertility. Applications to demographic transition. Easterlin's experienced living standard hypothesis. The Easterlin–Pollak–Wachter (Pennsylvania) model. A different modeling of the Easterlin hypothesis. Empirical testing of the Chicago–Columbia and Pennsylvania models.	

5	Economic Constraints upon Fertility: A Survey of Parental Attitudes	91
	Fertility modeling and attitude studies. Economic constraints upon fertility. The sample. The questionnaire. Profile of survey responses. Planned vs ideal family size. Relative lifestyle, income, and family size. <u>Conclusions.</u>	
6	Fertility Patterns of the Transition Onset: Insights of the Living Standard Model	109
	The living standard concept. Methodology. Background. The model. The model under different growth patterns. Empirical applications. Summary of analysis.	
7	A Lifestyle–Norm/Time Constraint Model for Analysis of Long-Run Changes in Fertility	132
	The approach. Family cohesion and security. Behavioral assumptions. A constraint model of fertility. The security norm: a digression. Analysis of time sets. Child norms. Determinants of child norms. Determinants of child time sets. Child time determinants. Time category constraints. Contributions of the norm/time constraint approach. <u>Summary and conclusions.</u>	
8	A Test of the Living Standard Model	159
	Origins of the demographic transition. Cross country vs time series testing. Country selection. Data limitations. Supply-side variables. Regression findings. Infant mortality. Education norms and female work force levels. Changes in per capita GDP. The housing standard. The fertility–mortality lag. Comparison with Western patterns.	
9	Policy Implications of the Lifestyle Approach	177
	Population and development. Policies for less developed countries. Policies in affluent economies. <u>Conclusions.</u>	
10	Agenda for Further Research	200
	Data generation studies. Time flexibility. Female employment. Norms. Family support of lifestyles. Lifestyle security in agrarian settings. Miscellaneous. The need for further studies.
