PART I
Foundations

Chapter 1  Introduction and Core Philosophy ................................................................. 3
  1.1 Landmarks: Memory Is Distributed, Memory is a Dynamic Property ............... 3
    1.1.1 Lashley's Equipotentiality ........................................................................... 3
    1.1.2 Hebb's Rules of Cooperativity ................................................................. 3
    1.1.3 Hayek: Perceiving is Classification of Objects by Activation of Associative Nets 4
  1.2 New Trends in Neuroscience ............................................................................ 5
  1.3 Copernican Changes in Memory Research ....................................................... 5
    1.3.1 Distributed Networks .................................................................................. 5
    1.3.1.1 Distributed Memory: Findings with Functional Magnetic Resonance Imaging ......................................................... 6
  1.4 EEG-Brain Dynamics ....................................................................................... 7
    1.4.1 Importance of EEG Studies .................................................................... 7
  1.5 Pioneering Studies of Brain Macrodynamics and Whole Brain Approach .......... 9
    1.5.1 Griffith: Statistical Mechanics in Biology and Physics ............................. 9
    1.5.2 Rosen: Global Neurodynamics ................................................................. 10
    1.5.3 Fessard: General Transfer Functions of the Brain .................................... 10
    1.5.4 Edelman: Reentrant Signalling Theory of Higher Brain Function ............ 11
  1.6 Freeman, Katschalsky, and Haken: Preliminary Steps in Introducing Macrodynamics of Electrical Activity .................................................. 11
  1.7 Application of Principles of Biological System Analysis to Brain Research .......... 13
    1.7.1 Reasons for Establishing Programs for Brain Research ............................. 13
    1.7.1.1 Program Steps .................................................................................... 14
    1.7.1.2 Mathematical Methods of Program ................................................... 15
  1.8 New Approaches to Brain Functioning at Macroscopic Level ....................... 15
    1.8.1 Sherrington's Neuron Doctrine Revisited ............................................... 15
    1.8.2 Renaissance of EEG Use in Search of Integrative Brain Functions .......... 16
  1.9 Neurons-Brain Theory: An Approach that Includes Whole Brain Organization ..... 17
    1.9.1 Topography of Cognition and Elements of Neurons–Brain Theory .......... 17
  1.10 Significance of EEG Brain Dynamics in Memory States and Integrative Brain Functions ...................................................................................... 19

Chapter 2  Concepts and Theories .............................................................................. 21
  2.1 Memory Machineries ....................................................................................... 21
    2.1.1 Dynamic Memory and APLR Alliance ..................................................... 21
    2.1.2 Steps of Memory Processing ................................................................. 21
    2.1.3 Encoding and Retrieval ............................................................................ 21
  2.2 Fractionation of Memory .............................................................................. 22
PART II
Experiments and Their Interpretation

Chapter 3 Shaping Dynamic and Evolving Memories by Reciprocal Activation of Attention, Perception, Learning, and Remembering

3.1 Essential Experiments Involving Dynamic Memory and Top-Down Activity

3.2 Dynamic Memory Manifested by Induced Alpha Activity

3.2.1 Selective Attention

3.2.2 APLR Alliance

3.2.3 Importance of Internal Event-Related Oscillations

3.2.4 Coherent and Ordered States of EEG due to Cognitive Tasks

3.2.4.1 Preliminary Experiments

3.2.4.2 Preliminary Results

3.4.3 Global Trends of Pretarget Event-Related Rhythms: Subject Variability

3.2.5 Paradigms with Increasing Occurrence Probability

3.2.5.1 3.5- to 8-Hz Range

3.2.5.2 8- to 13-Hz Range

3.2.5.3 40-Hz Range

3.2.6 Experiments with Light Stimulation

3.2.6.1 Experiments with Varied Probabilities of Stimulus Occurrence

3.2.7 Experiments with Subject A.F.

3.2.8 Quasideterministic EEGs, Cognitive States, and Dynamic Memories

3.3.8.1 Dynamics of Time-Locked EEG Patterns

3.3 Relations between Memory States and P300 Responses: EROs
3.3.2 Frequency Analysis of ERPs: Preliminary Results ........................................50
3.3.2.1 Comparison of EPs and ERPs ..........................................................50
3.3.2.2 Comparative Analysis of Poststimulus Frequency Changes under
       Different Conditions and Their Contributions to Different Latency
       Peaks .............................................................................................52
3.3.2.3 Formation of Peaks .........................................................................53
3.3.2.4 Comparison of ERP Responses to Regular and Random Infrequent
       Target Stimuli ................................................................................54
3.3.3 Orientation Reaction and Learning during Repetitive Stimulation ....56
3.4 Requirement of Preparation Rhythms for Activation of Working Memory: Analysis
       of Pre- and Poststimulus Activity in Single Sweeps ..................................57
3.4.1 Event-Related Theta Oscillations .............................................................57
3.4.2 Event-Related 10-Hz Oscillations ..............................................................57
3.4.2.1 Interim Summary ...........................................................................59
3.4.3 Modulation of P300 Activity by Preparation Rhythms .........................59
3.4.4 Control of Learnable Sequences by Prestimulus EEG Activity or Building
       of Memory Templates ........................................................................60
3.4.5 Varied Degrees of Augmentation and Prolongation: Gamma Oscillations
       in Memory Tasks .............................................................................61
3.4.6 Action of APLR Alliance and Hypothosis Concerning Reentrant Circuits ...63
3.4.7 Habituation ..........................................................................................63
3.4.8 Augmentation of Knowledge or Learned Material Is Reflected by Regular
       and Increased Alpha Activities .........................................................63

Chapter 4 Perception and Memory-Related Oscillations in Whole Brain ........65

Canan Başar-Eroğlu and Erol Başar

4.1 Relevance of Chapter .............................................................................65
4.2 Theta and Alpha Responses in Cat Brains during Cognitive and Memory-Related
       Tasks ..................................................................................................65
4.2.1 Introduction .........................................................................................65
4.2.2 Methods and Paradigms Utilized for Obtaining P300 Responses from Freely
       Moving Cats ......................................................................................66
4.2.3 Systematic Analysis of Effects of Repetition Rate of Omitted Tones on ERPs
       Recorded from Cat Hippocampi ..........................................................67
4.2.4 Utility of Analysis in Frequency Domain .............................................68
4.2.5 Multiple Electrodes in Hippocampus ....................................................68
4.2.6 Hippocampal P300 and Cognitive Correlates: Theta Components in CA3
       Layer .................................................................................................73
4.3 Compound P300–40-Hz Response of Cat Hippocampus .........................75
4.3.1 P300–40-Hz Compound Potential ........................................................75
4.4 Event-Related Oscillations in Cat Hippocampus, Cortex, and Reticular Formation
       during States of High Expectancy: Comparison with Human Data ..........77
4.4.1 Unit Activity and Behavior ..................................................................78
4.4.2 Event-Related Potentials in Cortex and Hippocampus in a P300-Like Paradigm ....79
4.4.3 Selectively Distributed Theta System: Involvement of Limbic, Frontal, and
       Parietal Areas ....................................................................................79
4.4.3.1 Integrative Analysis of Increased Theta Response ............................80
4.4.4 Interpretation of Changes in ERPs ......................................................80
4.4.4.1 Comparison with Human Responses ..............................................81
Chapter 5  Causal Factors Controlling Brain Responsiveness and Memory: Prestimulus EEG Activity, Entropy, and Genetics

5.1 Introduction ............................................................................................................. 87
5.2 Relationship of EEG and ERP .............................................................................. 88
5.3 Algorithm for Selective Averaging ....................................................................... 88
  5.3.1 Dependence of EP Amplitudes and Waveforms on Prestimulus EEG:
    Vertex Recordings ........................................................................................................ 88
      5.3.1.1 Auditory-Evoked Potentials .................................................................. 88
      5.3.1.2 Visual-Evoked Potentials .................................................................... 89
      5.3.1.3 Topographic Aspects ........................................................................... 90
  5.3.2 Frontal Visual-Evoked Potentials .................................................................... 91
  5.3.3 Inverse Relations of EEGs and Visual Responses ........................................ 92

5.4 Frequency Content of EROs from Different Locations: Major Operating Rhythms .......... 93
  5.4.1 Major Operating Rhythm (MOR) of Frontal Lobe: Theta?............................ 93
  5.4.2 MORs of Occipital and Central Region (Vertex) .......................................... 94
  5.4.3 Functional Significance of EEG–EP Interrelations ......................................... 94

5.5 Barry: Preferred States in Brain Activity ............................................................ 95
  5.5.1 Creation of Preferred Brain States by APLR Alliance .................................. 95

5.6 Causality of Brain Responses According to Changes in Oscillatory Networks .............. 96
5.7 Entropy as Causal Factor in Responses and Mechanisms of Super-Synergy ............... 96
5.8 Genetics as a Causal Factor in Delta and Theta Responses and Beta Rhythms ......... 98

Chapter 6  Correlation of Multiple Oscillations with Integrative Functions and Memory

6.1 Introduction ............................................................................................................. 101
  6.1.1 Aim of Chapter ............................................................................................... 101
      6.1.1.1 Emphasis on Multiple Oscillations in Brain Research ...................... 101
      6.1.1.2 Role of Oscillations in Memory Processing ....................................... 101
      6.1.1.3 Steps for New Synthesis and Binding Problem ............................... 102

6.2 Survey of EEG Oscillations .................................................................................. 102
  6.2.1 Alpha Activity .................................................................................................. 102
      6.2.1.1 Survey by Andersen and Andersson (1968) and Başar (1999) ........... 102
      6.2.1.2 Toward a Renaissance of Alphas ....................................................... 103
  6.2.2 Earlier Experiments on Induced or Evoked Theta Oscillations ..................... 103
  6.2.3 Gamma Frequency Range .............................................................................. 104

6.3 Selectively Distributed Oscillatory Systems: Distributed Multiple Oscillations .......... 104
  6.3.1 Concept, Definitions, and Methods .............................................................. 104
  6.3.2 Oscillatory Responses in Invertebrate Ganglia ............................................ 106
  6.3.3 Gamma Oscillations in Sensory, Cognitive, and Motor Processes .................. 107
      6.3.3.1 Multiple Functions in Gamma Band .................................................. 113
      6.3.3.2 Important Causality Factor for Human Gamma Response ............. 114
6.3.4 Alpha Oscillations in Perception and Cognition: The Alphas
6.3.4.1 Sensory Components
6.3.4.2 Cognitive Components
6.3.4.3 Resonance in Brain Responses
6.3.4.4 Multiple Functions in Alpha Frequency Window
6.3.5 Theta Oscillations in Perception and Cognition
6.3.6 Delta Oscillations in Cognition
6.3.7 Klimesch: Multiple Oscillatory Activities in Alpha Band
6.3.8 Oscillations in Highest Frequency Window
6.4 Superposition Principle and Superimposed Multiple Oscillations in Theta and Delta
Frequency Windows in Cognitive Processes: Examples
6.5 Selectively Distributed and Selectively Coherent Oscillatory Networks
6.6 Interim Conclusions
6.7 Distributed Oscillatory Systems and Distributed Memory
6.7.1 Event Processing in Distributed Systems
6.7.2 Multiple Functions of EROs and Multiple Functions of Memory:
Convergence of Concepts
6.7.3 Human Memory Performance and Time-Locked Theta Responses
6.8 EEGs and EROs as Information Codes
6.8.1 Frequency Coding at Different Levels
6.8.2 Most General Transfer Functions and Multiple Oscillations

Chapter 7  Are Integrative Brain Functions Shaped by Superbinding and Selectively
Distributed Oscillations?
7.1 Rationale and Usefulness of this Chapter
7.2 Binding Problem in Memory Processing and Gestalt
7.3 Neurons–Brain Theory and Oscillatory Codes
7.4 Description of Function–Memory Table
7.5 Super-Synergy: A Spatio-Temporal and Functional Organization of Multiple and
Distributed Oscillations
7.6 Gedanken Model: Involvement of Selectively Distributed and Coherent Activities of
Neural Populations in Grandmother Percept
7.7 Neural Populations and “Feature” Cells
7.7.1 Sokolov: Feature Detectors

Chapter 8  Grandmother Experiments in Perception of Memory: Recognition of Gestalts

Erol Başar and Murat Özgören
8.1 Introductory Remarks
8.2 Klimesch: Role of Theta and Alpha Oscillations in Memory and Attention Functions
8.3 Grandmother Paradigm and Gestalt Experiments
8.3.1 Experimental Strategy
8.3.1.1 Electrophysiological Recording
8.3.1.2 First Data Recording (Random) Set
8.3.1.3 Second Data Recording (Regular) Set
8.3.2 Event-Related Oscillations Arising from Light, Anonymous Face, and
Grandmother Face Stimulations
8.3.2.1 Topologies of Delta Responses
8.3.2.2 Topologies of Theta Responses
8.3.2.3 Topologies of Alpha Responses
8.3.2.4 Distributed Beta and Gamma Responses ..................................................160
8.3.3 Differentiation of Responses in Delta, Theta, and Lower and Upper Alpha
Frequency Bands: Preliminary Statistics .................................................................161
8.4 Recognition Memory and Gamma Oscillations ..................................................161
8.5 What Does the Grandmother Paradigm Mean? Are Oscillations Distributed
Templates in Memory Activation? ............................................................................161
  8.5.1 Selectively Distributed Enhancements in Whole Cortex ...............................164
  8.5.2 Efficiency of Grandmother Paradigm for Differentiation of Memory
Components or States ...............................................................................................165
  8.5.3 Does Activation of Larger Neural Populations Indicate Reactivation of
Episodic Memory? ....................................................................................................165
  8.5.4 Transition from Semantic to Episodic Memory: Distinctions between
Semantic and Episodic Memories .........................................................................165
  8.5.5 Importance of Frontal Lobes and Other Brain Areas for Memory Processing
and Perception ..........................................................................................................167
    8.5.5.1 fMRI Experiments Related to Distributed Memory in Cortex ..........167
    8.5.5.2 Critique of Experiments of Fernandez and Fell .................................167
    8.5.5.3 Major Activation Areas of Semantic and Episodic Memories ............168
    8.5.5.4 Superbinding and Stryker's Question about Oscillations .................168
  8.5.6 Do Grandmother Experiments Favor Hebb's Hypothesis? .........................168
8.6 Are the Descriptions of Gestalts and Emotions Related to More Complex Percepts
Possible? ....................................................................................................................169

PART III
Memory Function: Models and Theories

Chapter 9 EEG-Related Models of Memory States and Hierarchies .....................173

  9.1 Introduction of a New Construct on Memory Categorization .......................173
  9.2 Physiology of Selectively Distributed Oscillatory Processes .......................173
    9.2.1 Connections of Sensory–Cognitive Systems .......................................174
    9.2.2 Activation of Alpha System with Light .................................................175
    9.2.3 Activation of Alpha System with Auditory Stimulation .......................176
    9.2.4 Activation of Theta and Delta Systems Following Cognitive Inputs .........176
    9.2.5 Nonspecific Interactions .......................................................................178
  9.3 Hierarchical Categorization of Different Levels of Memory .........................181
    9.3.1 Fuster's View of Memory Networks: A Milestone in Neuroscience ........181
    9.3.2 Tentative Model Related to EEG Activation .........................................181
    9.3.3 Inborn (Built-In) Networks (Level I) ......................................................181
      9.3.3.1 Reflexes .........................................................................................183
      9.3.3.2 Stereotypic Fixed Action Patterns .................................................183
      9.3.3.3 Phyletic Memory and Oscillatory Response Codes ......................183
      9.3.3.4 Feature Detectors ............................................................................184
      9.3.3.5 Living System Settings ....................................................................184
    9.3.4 Physiological or Fundamental Memory ...............................................185
      9.3.4.1 Changes of Sensory Memory: Spontaneous and Evoked Alpha
Activity at Occipital Sites in Three Age Groups .................................................186
    9.3.5 Working Memory (Level II) .................................................................186
      9.3.5.1 Perceptual Memory ........................................................................187
Chapter 10 New Trends in Memory Dynamics: Concluding Remarks

10.1 The Emphasis of this Book: From a Research Program to a Theory on Whole-Brain Work

10.2 Distributed Memory in the Whole Brain

10.3 Correlation of Brain Oscillations with Multiple Brain Functions

10.4 Gestalts and the Grandmother Percept

10.5 Activated Memory Manifested by EEG Oscillations

10.6 Model Related to Memory States

10.7 Importance of EEG Analysis

Chapter 11 Memory and Whole-Brain Work: Draft of a Theory Based on EEG Oscillations

Erol Başar and Sirel Karakaş

11.1 Integration of Proposals Related to Whole-Brain Work

11.2 Whole-Brain Work Theory: How to Approach Brain Functions by Means of EEG Oscillations

11.2.1 Level A: Transition from Single Neurons to Oscillatory Dynamics

11.2.2 Level B: Superbinding of Neural Assemblies (Supersynergy)
