2.5	Robustness Considerations	28
2.5.1	Generalized Nash-Bargaining	28
2.5.2	CES Technology	29
2.5.3	Benefits as a Function of the Average <i>Wage</i>	29
2.5.4	Is the Reservation Wage a Function of the Level of Benefits? Are the Benefits a Function of the Average Standard of Living?	30
2.5.5	Competitive Market for Unskilled Labor	30
2.6	Summary and Conclusion	32
2.7	Appendix	35
2.7.1	Empirical Evidence	35
2.7.2	The Extensive-Form Game Underlying the Nash Bargaining Solution	36
2.7.3	The Nash-Bargaining Solution	37
2.7.4	CES Technology	38
3	Substitution in Consumption and Factor Demand	41

3.1	Introduction	41
3.2	The Basic Model	43
3.2.1	Firms	44
3.2.2	Consumers	45
3.2.3	General Equilibrium	46
3.3	Factor-Bias and Sector-Bias	47
3.3.1	Technology	47
3.3.2	Analysis	48
3.3.3	Asymptotic Behavior of the Equilibrium Outcomes	49
3.4	Discussion of the Results	53
3.4.1	Hairdressing as an Extreme but Illustrative Example of Factor- and Sector-Bias	53
3.4.2	Synopsis	57
3.4.3	Conclusion	58
3.5	Appendix	61
3.5.1	Proof of Proposition 4: Existence and Uniqueness of the Gen- eral Equilibrium	61
3.5.2	Pure Factor Bias	62
3.5.3	Pure Sector Bias	64
3.5.4	Factor Immobility	67
4	Working Time Reduction	69
4.1	Introduction	69
4.2	The Model	72
4.2.1	Production in Firms	72
4.2.2	Consumption and Home Production	77
4.2.3	General Equilibrium	79
4.3	Employment Effects of Working Time Reduction	80
4.4	Endogenous Changes in Working Time	82

4.4.1	Analysis	83
4.4.2	Numerical Simulations	85
4.4.3	Summary	87
4.5	Discussion of the Assumptions	88
4.5.1	Unemployment	88
4.5.2	Home Production	89
4.5.3	Working Time Reduction With or Without Compensatory Wage Increases	90
4.6	Summary and Conclusion	90
4.7	Appendix	91
4.7.1	Proofs	91
4.7.2	Graphical Illustration	95

List of Figures

- 2.1 **Benefits Vs GDP per Capita in 1990 Prices, West Germany 1970 - 1998.** Vertical axis: Benefits: German Welfare Rate (“Sozialhilfe-Eckregelsatz”) for a four-person household (two adults, two children) in Euros in consumer prices of 1990, Source: German Federal Ministry of Labor. Horizontal axis: GDP per Capita Germany: in Euros in consumer prices of 1990, Source: EuroStat. 19
- 3.1 **Hourly wages: Hairdressing Vs. All Sectors.** Indices of hourly standard wages in West-Germany (1991=100). Source: Statistisches Bundesamt. 55
- 3.2 **Simulation of the evolution of the relative wage ω (vertical axis) over time** as a function of the substitution elasticity in consumption demand σ for $\theta = 2$, $\lambda = 0.1$, $\alpha = 0.5$ 60
- 4.1 **Allocation of Types to Sectors.** Horizontal axis: type j , vertical axis: wage w_j 74
- 4.2 **Allocation of Types to Sectors and Unemployment.** Horizontal axis: type j , vertical axis: wage w_j 77
- 4.3 **Relative goods price p (vertical axis) as a function of working time ξ (horizontal axis)** for different values of σ between 0 (steepest line), and ∞ (flattest line). $A = 1$, $\phi = 1$, $\chi = 1$, $\mu = \frac{1}{2}$ 80
- 4.4 **Unemployment rate \bar{j} (vertical axis) as a function of working time ξ (horizontal axis)** for different values of σ between 0 (steepest line), and ∞ (flattest line). $A = 1$, $\phi = 1$, $\chi = 1$, $\mu = \frac{1}{2}$ 81

- 4.5 **Yearly Working Hours Vs. GDP p.c. in 1990 prices for Germany, 1870 - 1990.** Horizontal axis: Year. Vertical axis, left scale: Average annual working hours in Germany. Source: Maddison (1991) and (2001). Vertical axis, right scale: GDP per capita in 1990 Geary-Khamis US \$. Source: Maddison (1995). 82
- 4.6 **The unemployment rate \tilde{j} (vertical axis) as a function of productivity A (horizontal axis) for different values of σ between 0 (lowest line) and 1 (uppermost line) with $\chi = 1$, $\mu = 0.6$, $\phi = 2.5$. . . 86**
- 4.7 **The unemployment rate \tilde{j} (vertical axis) as a function of productivity A (horizontal axis) for different values of ϕ between 1.5 (lowest line) and 2.5 (uppermost line) with $\chi = 1$, $\mu = 0.6$, $\sigma = \frac{2}{3}$. . . 87**
- 4.8 **Unemployment \tilde{j} (vertical axis) as a function of working time ξ (horizontal axis) for $A = 30$, $\phi = 5$, $\chi = 1$, $\mu = 0.5$ and σ between 0 (steepest line) and 1 (flattest line). 96**
