

Valuation and Risk Management of Interest Rate Derivative Securities

Summary of contents

1. An integrative perspective on the risk management of interest rate derivatives	1
<i>Part One: Valuation</i>	
2. Basic concepts in valuing interest rate derivative securities	18
3. Continuous time models of the term structure of interest rates	59
4. Valuation of interest rate derivative securities in the Swiss market	93
<i>Part Two: Applications</i>	
5. Risk and return in the bond markets	134
6. Risk management instruments	208
7. Measuring and hedging risks in interest rate derivative securities	246
8. Implications for risk management	299

Table of contents

List of figures	vii
List of tables	xi
List of abbreviations	xiv
Commonly used notations	xvi
1. An integrative perspective on the risk management of interest rate derivatives	1
1.1 The markets for interest rate derivatives	3
1.2 A framework for the management of market risk in interest rate derivative securities	10
1.3 Scope and outline of the text	14
2. Basic concepts in valuing interest rate derivative securities	18
2.1 General equilibrium models of the term structure of interest rates	20
2.1.1 The model framework and the fundamental valuation equation in discrete time	21
2.1.2 The term structure of interest rates	27
2.1.3 Risk premia in discrete time	33

2.2	Arbitrage models of interest rate derivative securities	37
2.2.1	The fundamental valuation equation under an arbitrage perspective	37
2.2.2	Construction of an equivalent martingale measure	41
2.2.3	Model-parametrization and model-application: Valuation of futures and options	47
a)	The valuation of futures on discount bonds	48
b)	The valuation of European call and put options on discount bonds	50
c)	Model parametrization: a second look at the definition of a complete market	54
2.3	Summary: The relationship between general equilibrium and arbitrage models	56
3.	Continuous time models of the term structure of interest rates	59
3.1	Extending the pricing methodology to continuous time	60
3.1.1	The structure of continuous time models	60
3.1.2	The fundamental valuation equation in continuous time	63
3.2	The state variables and their stochastic process	68
3.2.1	Alternative specifications of the state variables	68
3.2.2	The stochastic process governing the state variable	74
a)	Alternative stochastic process specifications	74

b)	Empirical evidence on the performance of alternative stochastic processes in the Swiss market	79
3.3	A complete model specification and the general implementation approach	84
3.3.1	The functional form of the interest rate risk premium	84
3.3.2	A complete market implementation in continuous time	86
3.4	Summary	91
4.	Valuation of interest rate derivative securities in the Swiss market	93
4.1	Model implementations for the Swiss market	94
4.1.1	The impact of the particularities of the Swiss market on alternative model implementations	94
4.1.2	An arbitrage model implementation incorporating a discrete term structure	97
4.2	Model parametrization for the Swiss market	104
4.2.1	Alternative parametrization approaches for the arbitrage model	104
4.2.2	Parameter estimation from historical data: a representative investor perspective	107
a)	The estimation approach	107
b)	The data	111
c)	The estimation results	114
4.2.3	The completely parametrized arbitrage model	121
a)	Choosing from the alternative parameter specifications	122
b)	Interpretation of the time dependent parameter values	125
c)	A first model application: The continuous term structure of interest rates	127
4.3	Conclusions and implications for subsequent applications	130

5. Risk and return in the bond markets	134
5.1 General risk and return properties of bonds	135
5.1.1 Straight bonds	136
5.1.2 Callable bonds	139
5.2 The valuation under credit risk and option adjusted spreads	149
5.2.1 Valuation under credit risk	149
a) Modeling credit risk	150
b) The fundamental valuation equation under credit risk	154
5.2.2 Model implementation and estimation procedures for the Swiss bond markets	155
a) Model implementation for the Swiss market	156
b) Model parametrization for the Swiss market	158
5.2.3. Applications of the extended model: Option adjusted spreads	163
a) Market spreads and term structure estimation	164
b) Security specific spreads as an index of value	166
c) Applications of option adjusted spreads in the risk management process	169
5.3 An empirical investigation of non-subordinated bonds of Swiss AAA-banks	174
5.3.1 Description of data and analysis of market structure	174
5.3.2 Empirical results	184
a) Equilibrium option adjusted spreads	186
b) Deviations of model from market prices	187
c) Investigation of the model specification	197
5.4 Summary	205
6. Risk management instruments	208
6.1 Swaps	209
6.2 Futures	218
6.2.1 Theoretical valuation of medium term SOFFEX bond futures	219

6.2.2	Empirical analysis of the pricing of UBS-bond futures	223
6.3	Option products	228
6.3.1	Product variations	229
6.3.2	Empirical analysis of the pricing of SBC-bond options	233
6.4	Summary	244
7.	Measuring and hedging risks in interest rate derivative securities	246
7.1	Analytical tools for measuring risks in interest rate derivative securities	248
7.1.1	Alternative interest rate risk measures	252
a)	The empirical determination of standard key rate scenarios	253
b)	Modeling general interest rate scenarios	258
7.1.2	Volatility and spread risk measures	264
7.2	Hedging	269
7.2.1	Immunization	270
7.2.2	Hedging with spread risk	276
a)	Efficient hedging strategies in the presence of spread risk	276
b)	Alternative time horizons and the hedging potential in the presence of spread risk	287
7.3	Summary	296
8.	Implications for risk management	299
Appendix:	Information on bond data	304
Bibliography		309
