

# Contents

Preface	xi
Reading this book quickly	xii
Part I: Introduction	
Chapter 1: Advertisement	3
Chapter 2: History	9
Chapter 3: The language of sequential analysis	15
3.1 The moving time window	16
3.2 Summary statistics	16
3.3 The base rate problem	17
3.4 The language of Markov chains	18
3.5 Markov models	19
3.6 Example	20
3.7 Higher-order Markov models	21
3.8 The odds ratio	24
3.9 Four indices of sequential connection	25
3.10 How children become friends	30
3.11 Discrete time semi-Markov models	30
3.12 Our overall plan	31
Part II: Fitting the timetable	
Chapter 4: The order of the Markov chain	35
4.1 Shannon's approximations to English	35
4.2 Information	37
4.3 The plan of our discussion	37
4.4 Likelihood ratio chi-squared tests	38
4.5 Digram structure	40

4.6	Contingency-style tables	40
4.7	Independence	42
4.8	Testing independence	43
4.9	Cellwise examination of contingency tables	44
4.10	Information theory	46
4.11	Reduction in uncertainty	49
4.12	Exercise	52
4.13	Use of the $LRX^2$ to determine order	53
4.14	Order for specific sequences	57
Appendix 4.1: Degrees of freedom for order of the Markov chain		58
Appendix 4.2: $LRX^2$		58
Chapter 5: Stationarity of the Markov chain		60
5.1	One dyad	61
5.2	Omnibus test for stationarity	62
5.3	Other reasons for dividing the data into segments	63
5.4	An alternative to the omnibus test	66
Chapter 6: Homogeneity		67
6.1	Hirokawa (1980)	68
6.2	Sillars (1980)	68
6.3	Capella (1980)	72
6.4	Valentine and Fisher (1974)	72
6.5	Cline (1979)	73
6.6	Hawes and Foley (1973)	75
6.7	Lichtenberg and Hummel (1976)	76
6.8	Hawes and Foley (1976)	76
Chapter 7: Everyday computations of stationarity, order and homogeneity		77
7.1	The Arundale programs	77
7.2	Example	77
7.3	Stationarity	78
7.4	Order	80
7.5	Homogeneity	80
7.6	Homogeneity analyses as an opportunity for discovery	80
7.7	Setting alpha levels	83
Chapter 8: Sampling distributions		85
8.1	Binomial distribution	85
8.2	Poisson distribution	87
8.3	Negative binomial	88
8.4	Hypergeometric distribution	89

8.5	Multinomial distribution	90
8.6	Product multinomial distribution	90
8.7	Example	92
Chapter 9:	Lag sequential analysis	95
9.1	Deciding between z-scores: The type I error rate	99
9.2	Uses of lag sequential analysis	100
9.3	A new lag sequential analysis rule of thumb	100
9.4	Detecting cyclicity	103
9.5	Studying coalitions within groups	103
9.6	Examples	103
9.6.1	Ting-Toomey (1983)	103
9.6.2	Bakeman and Adamson (1983)	105
9.6.3	Margolin and Wampold (1981)	106
9.6.4	Cousins and Vincent (1983)	108
9.6.5	Revenstorf et al. (1981)	109
9.7	Independence assumption in computing z-scores	109
Part III:	The timetable and the contextual design	
Chapter 10:	Log-linear models	113
10.1	Notation for log-linear models	115
10.2	Three-way classification	117
10.3	Playing with the notation	118
10.3.1	Case (1)	118
10.3.2	Case (2)	118
10.4	Hierarchical, non-hierarchical, and conditional nested models	121
10.5	Statistical tests	122
10.6	Getting expected counts	123
10.7	Model building and testing	126
10.8	Computing degrees of freedom	127
10.9	Model fitting step by step	127
10.10	Selecting a model by screening	129
10.11	Contrasts	130
10.12	The analysis of residuals	131
10.13	The homogeneity problem again	131
Chapter 11:	Log-linear models: review and examples	133
11.1	Model building and selection of categorical data models	133
11.2	Brown's measures of marginal and partial association	136
11.3	Standardized parameter estimates	137
11.4	Stepwise selection procedures	137

11.5	Examples	139
11.5.1	Brent and Sykes (1973)	139
11.5.2	Vuchinich (1984)	143
11.6	Nested hierarchical models	149
11.7	Worked example	150
11.7.1	Markov model omnibus test	150
11.7.2	Log-linear analyses	151
Appendix 11.1:	Likelihood ratio tests	156
Appendix 11.2	Matrix formulation	159
Appendix 11.3:	The relationship between information theory and log-linear models (James T. Ringland)	161
Appendix 11.4:	Rationale for comparing models	164
Chapter 12:	A single case analysis of the timetable	168
12.1	A six-step procedure	168
12.2	Forming the timetable	170
12.3	Writing the models down	172
12.4	Preliminary consideration in comparing the models	173
12.5	Comparing models	174
12.5.1	Step 1: Markov model analysis	174
12.5.2	Step 2: Submodel fitting	176
12.5.3	Step 3: Residual examination and cell removal	176
12.5.4	Step 4: Check all reasonable submodels	177
12.5.5	Step 5: Check larger models	178
12.5.6	Step 6: Interpretation of the model	179
Appendix 12.1:	Freeman-Tukey deviates	187
Chapter 13:	Logit models and logistic regression	189
13.1	Introduction	189
13.2	Why we need the logit transformation	191
13.2.1	The difficulties of the standard regression model: "Linear probability model"	191
13.2.2	Transformation approaches	193
13.2.3	Probit transformation	194
13.2.4	Logit transformation	196
13.3	Logit analysis: grouping data across subjects within each cell	201
13.4	Logit analysis within grouping subjects: logistic regression	212
13.5	Polytomous variables: multiple choice models	217
13.6	Incomplete tables: problem of empty cells	220
13.7	Example	220

Appendix 13.1: The relationship between log-linear and logit models	222
Appendix 13.2: Computer programs for data analysis	226
Chapter 14: The problem of autocontingency and its solutions	228
14.1 The problem	228
14.2 Sackett's computational solution	230
14.3 The logit linear solution	232
14.3.1 Chi-squared test	232
14.3.2 Logit linear model	233
14.4 The Gardner-Hartmann correction	234
14.5 Untested suggestions	235
14.5.1 Binary time-series analysis solution	235
14.5.2 Controlling for autocontingency of more than one time lag	236
Appendix 14.1: Sackett's computational correction	239
Chapter 15: Recent advances: a brief overview	240
15.1 Introduction	240
15.2 Kraemer and Jacklin (1979); Mendoza and Graziano (1982); and Iacobucci and Wasserman (1987)	241
15.3 Wampold and Margolin (1982) and Wampold (1984)	242
15.4 Dillon, Madden, and Kumar (1983)	243
15.5 Feick and Novak (1985)	243
15.6 Faraone and Dorfman (1987)	244
15.7 Budescu (1984)	244
15.8 Log-linear or logit-linear models?	245
Chapter 16: A brief summary	248
16.1 The data	248
16.2 Forming the timetable: determining order and stationarity	248
16.3 Homogeneity: the decisions of how to best group subjects	248
16.4 Within-subject analyses	249
16.5 Pooling across subjects	249
16.6 Doing the minimum	249
References	251
Index	265
