
TABLE OF CONTENTS

PREFACE.....	3
ACKNOWLEDGEMENTS.....	8
1. INTRODUCTION AND OVERVIEW	19
1.1 Context: brief history of the policy-making exercise	19
1.2 Why do we need baselines?.....	21
1.2.1 What is the experience to date with emission baselines?.....	23
1.2.2 How can we build on lessons learned from this experience?.....	24
1.3 Finding the environmental and economic “balance”	25
1.3.1 Environmental effectiveness of projects	26
1.3.2 Transparency	28
1.3.3 Baseline development cost and crediting risks	28
1.3.4 Finding the balance	29
1.4 Key steps/issues in standardising baselines and baseline development	29
1.4.1 How can baselines be standardised?	31
1.4.2 Baseline aggregation	32
1.4.3 Baseline lifetime	34
1.4.4 Project boundaries.....	35
1.4.5 Data assumptions and availability.....	36
1.4.6 Baseline units	37
1.5 Conclusions and next steps.....	38
1.5.1 Maximise environmental effectiveness of the mechanisms.....	38
1.5.2 Learning by doing	40
1.5.3 Consider sector characteristics and opportunities for standardisation	40
1.6 References	42
2. CEMENT CASE STUDY	45
2.1 Executive summary	45
2.2 Broad overview of the cement sector	49
2.2.1 India case study.....	54
2.2.2 Czech case study	56
2.2.3 China case study.....	56
2.3 Baseline construction.....	59
2.3.1 Key underlying assumptions.....	60

2.3.2	Aggregation.....	62
2.3.3	System boundaries and data issues	66
2.4	Potential baseline assumptions	76
2.4.1	Energy efficiency and process change projects	76
2.4.2	Fuel input change projects	78
2.4.3	Blending projects	79
2.4.4	Baseline lifetime	81
2.5	Potential stringency of baselines	84
2.6	Conclusions	90
2.7	References	95
3.	ELECTRICITY GENERATION CASE STUDY	99
3.1	Executive summary	99
3.2	Context	105
3.3	Broad overview of sector.....	106
3.3.1	Brazilian electricity context	109
3.3.2	Indian electricity context.....	110
3.3.3	Moroccan electricity context.....	112
3.4	Baseline construction: Environmental performance.....	112
3.4.1	Key underlying assumptions	112
3.4.2	Data needs, quality and availability	122
3.4.3	Aggregation.....	125
3.4.4	Baseline calculation	125
3.5	Potential baseline assumptions	127
3.5.1	National average GHG performance of all existing electricity capacity.....	127
3.5.2	National average GHG Performance (of recent capacity additions (after 1994)	127
3.6	Potential stringency of baselines	137
3.7	Potential volume of projects	140
3.8	Insights and conclusions.....	142
3.9	References	161
4.	ENERGY EFFICIENCY CASE STUDY.....	166
4.1	Executive Summary.....	167
4.2	Introduction	172
4.3	Sector Overview	173
4.3.1	Energy efficiency sector trends.....	174
4.3.2	Energy efficiency market trends	177
4.3.3	Barriers to investments in energy efficiency.....	177
4.3.4	Trends in energy efficiency projects and baseline implications	178
4.4	Baseline Construction.....	180
4.4.1	Baseline calculation: data needs, quality and availability.....	180
4.4.2	Essential steps in baseline construction	187

4.4.3	Energy use baseline construction - application to energy efficiency projects and programmes implemented in developing countries	189
4.5	Standardising Baseline Assumptions.....	191
4.5.1	Determining standard baseline performance.....	194
4.5.2	Standard calculation and data protocols - lighting and motors	195
4.5.3	Standardising operating and performance parameters - lighting and motors	197
4.5.4	Energy use indices - lighting and motors.....	203
4.5.5	Data issues	206
4.6	Issues in constructing baselines.....	207
4.6.1	Baseline construction and the potential volume of energy efficiency projects	207
4.6.2	Potential biases in baseline construction: free riders and spillover effects	210
4.6.3	Baseline stringency	211
4.7	Insights and conclusions.....	213
Annex A:	Examples of baseline development for energy efficiency projects and energy efficiency market assessment	217
4.8	References	233
5.	IRON AND STEEL CASE STUDY.....	239
5.1	Executive summary	239
5.2	Introduction	244
5.2.1	Iron and steel production processes	244
5.2.2	Production and expected growth.....	247
5.2.3	Major players	250
5.2.4	Regional production trends	250
5.2.5	Case studies: India, Poland and Brazil	252
5.2.6	Comparison of the case study countries.....	261
5.3	Baseline construction: environmental performance	262
5.3.1	Input data	262
5.3.2	Aggregation.....	265
5.3.3	Proposed baselines	267
5.3.4	Other issues: Fixed versus revisable baselines and timelines	272
5.3.5	Scoring the baselines.....	273
5.4	Baseline construction: potential volume of projects.....	274
5.5	Conclusions and recommendations	277
5.6	References	280
GLOSSARY.....		282

LIST OF FIGURES

Figure 1-1: Possible effect of baseline stringency and complexity on project numbers and a project’s environmental additionality.....	39
Figure 2-1: Process steps in cement manufacture	50
Figure 2-2: Energy use of different steps within “best practice” cement manufacture.....	51
Figure 2-3: Potential project boundaries for JI/CDM projects in cement manufacture	67
Figure 2-4: Different plant performances and potential baseline values for pyro-processing.....	85
Figure 2-5: The effect of different baselines for different project types on potential credits	86
Figure 2-6: CO ₂ intensity of pyro-processing in selected plants.....	88
Figure 3-1(a): World electricity generation by region	107
Figure 3-1(b): World electricity generation by fuel.....	108
Figure 3-2: Total electricity generation in Brazil (all existing capacity in 1997)	110
Figure 3-3: Multi-project baselines using recent capacity additions: All sources and fossil fuel only	129
Figure 3-4: Multi-project baselines using recent capacity additions: Brazil’s regions (all sources).....	134
Figure 3-5: Multi-project baselines using recent capacity additions: Load-specific (India)	136
Figure 3-6: Brazil: Implications of multi-project baselines using recent capacity additions	138
Figure 3-7: India: Implications of multi-project baselines using recent capacity additions	139
Figure 3-8: Morocco: Implications of multi-project baselines using recent capacity additions	139
Figure B3-1: Brazil: Recent electricity generation capacity	153
Figure B3-2: India: Recent electricity generation capacity.....	154
Figure B3-3: Morocco - Recent Electricity Generation Capacity	155
Figure 4-1: Illustration of an energy use (per unit of energy service) baseline estimation	189
Figure 4-2: Distribution of motors by horsepower (Mexico Motors Replacement Project)	202
Figure A4-1: Distribution of motors by horsepower.....	227
Figure A4-2: Distribution of motors by percentage of load.....	228
Figure 5-1: Processes for steel production	248
Figure 5-2: Energy efficiency index trends for iron and steel production in selected countries	252

Figure 5-3: Relative amount of steel produced by the different process routes in India from 1982 to 1995	254
Figure 5-4: Energy consumption for steel plants in India.....	255
Figure 5-5: Crude steel production in Brazil	257
Figure 5-6: Primary energy consumption in the Brazilian iron and steel industry	258
Figure 5-7: SEC development of the iron and steel sector in Brazil.....	259
Figure 5-8: Total production of crude steel in Poland (1999 data are provisional)	260
Figure 5-9: An illustration of the “graduated crediting” concept	270

LIST OF TABLES

Table 2-1: Summary of factors that determine GHG emissions from cement manufacture	53
Table 2-2: Energy Intensity of Cement Production, India.....	55
Table 2-3: Energy Intensity of Cement Production, Czech Republic.....	56
Table 2-4: Effect of a process change on the energy intensity of clinker production in two cement plants in China	58
Table 2-5: Variations in fuel and electricity intensity of different components of the cement manufacturing process	71
Table 2-6: Suggested baseline energy components and other assumptions for energy-related projects in the cement sector	77
Table 2-7: Clinker to cement ratio in key developing countries (1980, 1990, 1995)	80
Table 2-8: The effect of different standardised energy baseline values on the number of credits.....	87
Table 3-1: Relative importance of Greenhouse Gases.....	114
Table 3-2: Multi-project baselines based on recent capacity additions: Source-specific	131
Table 3-3: Potential emission credits (per GWh) generated by projects in BAT coal and BAT gas under different multi-project electricity baselines based on recent capacity additions	132
Table B3-1: Brazil: Number of recently added generating units (excludes CHP plants)	153
Table B3-2: India: Number of recently added generating units (excludes recent CHP plants)	154
Table C3-1: Recent (operation started after 1994) electricity generation plants and plants under construction: Assumptions for load factors and efficiencies .	156
Table D3-1: Baselines based on entire existing generation capacity in 1997	157
Table E3-1: Brazil.....	158
Table E3-2: India	159
Table E3-3: Morocco	159
Table F3-1: Brazilian sub-national baselines based on recent capacity additions (after 1994) and those under construction	160
Table F3-2: Indian baselines for peak and baseload based on recent capacity additions (after 1994) and those under construction	160

Table 4-1: Vietnam's changing sectoral and end-use electrical energy shares.....	176
Table 4-2: Summary of implications for standardisation from energy efficiency case studies.....	192
Table 4-3: Lamp performance data (Mexico Ilumex project).....	199
Table 4-4: Summary of lighting characteristics by urban and rural areas	199
Table 4-5: Summary of commercial indoor lighting (Morocco DSM research study) ...	200
Table 4-6: Framework example of standardised baseline parameters for lighting efficiency projects.....	200
Table 4-7: Distribution of electric motors by application and demand.....	203
Table 4-8: Framework example for standardised energy use baseline motor efficiencies for energy efficiency projects.....	203
Table 4-9: Framework example for lighting energy use indices.....	205
Table 4-10: Framework example for electric motor energy use intensities.....	206
Table A4-1: Lamp performance data	220
Table A4-2: AIJ component baseline and estimated GHG reductions	221
Table A4-3: Incandescent and CFL wattages	223
Table A4-4: Summary of lighting characteristics by urban and rural areas.....	224
Table A4-5: Distribution of indoor incandescent lamps by wattage.....	224
Table A4-6: Summary of commercial indoor lighting.....	225
Table A4-7: Distribution of motors by brand	226
Table A4-8: Distribution of electric motors by application and demand.....	230
Table A4-9: Distribution of lighting fixtures by wattage and type.....	230
Table 5ES: Scoring the proposed baselines for refurbishment projects in the iron and steel sector against selected criteria.....	243
Table 5-1: The twenty largest steel producing countries and their change in production in 1999 relative to 1992.....	249
Table 5-2: The twenty largest steel producing companies in the world in 1998	250
Table 5-3: Production and number of large-scale plants in the Indian iron and steel industry in 1995/96.....	253
Table 5-4: Specific energy consumption and CO ₂ emission factors for the different process routes in 1994/5, India	255
Table 5-5: Fuel inputs in the Indian iron and steel sector (1994/5)	256
Table 5-6: The specific energy consumption and carbon intensity of the Brazilian iron and steel sector.....	258
Table 5-7: Fuel inputs in the Brazilian iron and steel sector (1995).....	259
Table 5-8: Fuel inputs in the Polish iron and steel sector (1995).....	261
Table 5-9: Comparing CO ₂ -intensities for the different process routes.....	261
Table 5-10: Comparing energy intensities of steel production in selected countries and processes.....	263
Table 5-11: Indication of past autonomous efficiency improvements.....	264
Table 5-12: The differences between hot rolling and cold rolling with regard to energy intensity on a best practice basis.....	264
Table 5-13: A technology matrix for the casting process in an integrated steel	

plant that produces flat products.....	272
Table 5-14: Scoring the proposed baselines for the iron and steel sector against the criteria	275
Table 5-15: Potential volume of refurbishment projects in the iron and steel plants in India	277
