<i>Preface</i>	<i>page xvii</i>
<b>1 An Introduction to the Investment Environment</b>	<b>1</b>
Introduction	1
Primary and secondary markets	2
Cash and money market instruments	3
Equity markets	5
Bond markets	6
Domestic bond markets	7
International bond markets	8
Currencies	9
Derivative instruments	10
Futures contracts and forward contracts	12
Options and warrants	12 ✓
Swaps	12
The international nature of financial markets	13
Financial innovation in response to growing financial risk	17
Brief history of the major themes in the theory of investment management	18
<b>2 The Efficient Markets Hypothesis</b>	<b>21</b>
Introduction	21
The efficient markets hypothesis (EMH)	21
Forms of informational efficiency	21
Implications of EMH	22
Empirical tests of market efficiency	22
Weak form efficiency	23
Tests for serial correlation	23
Runs tests	25
Filter tests	25
Why should security prices be random?	26
The statistical distribution of short-term security returns	27
The lognormal distribution	27
Summary of evidence of randomness	29
Semi-strong form efficiency	29
Strong form efficiency	30
Are the markets totally efficient?	31
Information content of analysts' forecasts	32
Persistent anomalies	32
Low P/E effect	32

Small firm effect	33
High yield effect	33
Neglected firm effect	34
The seasonality of security returns	34
The interdependence of anomalies	35
How valid are these anomalies?	36
The mean reverting nature of asset returns	36
<b>3 Modern Portfolio Theory</b>	<b>43</b>
Introduction	43
The principles of Modern Portfolio Theory	43
The creation of risk	43
Factors in systematic risk	44
Factors in unsystematic risk	44
The measurement of risk and return in individual assets	45
The Markowitz mean-variance model	46
Calculating the returns and standard deviation of a portfolio	47
The effects of diversification	50
The grounds for assuming normally distributed returns and using mean-variance analysis in portfolio construction	53
The efficient frontier	53
The investors' utility function	56
Choice of portfolio	57
<b>4 Equilibrium Asset Pricing Models</b>	<b>60</b>
Introduction	60
Adding a risk-free asset to the set of investible assets	60
Borrowing at the same risk-free rate	62
Combining risk-free borrowing and lending	63
The CML when borrowing is at a higher rate than risk-free lending	64
The Capital Asset Pricing Model (CAPM)	65
The effects of diversification under CAPM	68
Deriving the inputs for portfolio optimisation	70
Estimating beta	70
Zero beta CAPM	72
The empirical evidence of CAPM	73
The first stage: time series tests	74
The second stage: cross-section regressions	75
Multi-factor models	79
The Arbitrage Pricing Theory	79
Empirical tests of APT	82
Fundamental multi-factor models	83
<b>5 The Asset Allocation Process</b>	<b>88</b>
Introduction	88
The investment decision making process	88
The concept of risk revisited: the role of the benchmark portfolio	89

The asset allocation process	90
Strategic asset allocation	90
The policy benchmark or normal portfolio	91
The importance of strategic asset allocation	92
Tactical asset allocation: a three stage process	92
Stage 1: research and analysis into expected returns, variances and covariances of asset classes	93
Stage 2: determining the array of efficient portfolios	96
Stage 3: determining the risk/return combination of the optimum portfolio	100
How effective is tactical asset allocation?	101
International asset allocation	101
An international element to strategic asset allocation	102
International tactical asset allocation	102
Foreign currency as a separate asset class in asset allocation	105
<b>6 Currency Risk: Its Role and Impact</b>	<b>110</b>
Introduction	110
The functioning of the foreign exchange market	110
The quotation of exchange rates	110
The determination of forward exchange rates	112
The outright forward rate	112
The forward margins	112
Interest Parity Theory and the fair pricing of currency forwards	113
The risks and returns of foreign currency assets	114
The returns to a single foreign currency asset	114
The returns and risks of unhedged foreign currency assets	115
The returns to unhedged foreign currency assets	115
The effect of foreign exchange returns on total returns	116
The risks embodied in unhedged foreign assets	117
Risk in an unhedged portfolio of foreign assets	118
The returns and risks to currency hedged assets	120
The returns to a currency hedged asset	120
The risk embodied in currency hedged assets	122
The case for hedging foreign currency assets in portfolio	122
Currency exposure as a hedge against inflation	124
How much to hedge – what is your objective?	125
Capturing the magnitude and volatility of local currency returns	125
Minimising the variance of returns in the numeraire currency	125
Measuring currency exposure	126
Determining the amount of currency to hedge	128
To hedge or not to hedge? Currency volatility in the context of an overall portfolio view	128
Currency as a separate asset class: currency overlay	129
<b>7 The Valuation of Equities</b>	<b>135</b>
Introduction	135

The absolute valuation process for equities	136
What cash flows?	137
Dividend discount models	139
Constant growth model	142
Relaxing the assumptions	145
Multi-stage dividend discount models	145
External financing	146
The application of dividend discount models	146
Determining the discount rate, $k$	147
The dividend decision and valuation	148
The price/earnings ratio approach	149
The relationship between price/earnings ratios and dividend discount models	149
Factors affecting the magnitude of the P/E ratio	150
Application of P/E ratios	152
The empirical evidence of earnings forecasting	152
What are we forecasting?	153
The effectiveness of analysts' forecasts	153
The relative valuation of equities	155
A multi-factor model of asset returns	156
The methodology of creating multi-factor models	158
Concerns about data and methodology	161
The integration of the factor model and the dividend discount model approaches	163
<b>8 Bonds: Their Characteristics and Valuation</b>	166
Introduction	166
The risks associated with straight bonds	166
Interest rates as compensation for risk	167
Valuation of 'straight' bonds	168
Valuation of default risk-free bonds	168
Zero coupon bonds	168
Valuation of a coupon paying bond	168
Valuation of bonds with default risk	170
Spot rates, forward rates and quality spreads	172
Spot rates and forward rates compared	175
Quality spreads again	176
The nature of the term structure of interest rates	176
Theories of the determination of the term structure	179
The expectations hypothesis	179
The liquidity preference hypothesis	180
The market segmentation hypothesis	180
Empirical evidence of the term structure	180
The dynamics of the term structure	181
Returns from holding securities	181
Current or running yield	182
Yield to maturity or gross redemption yield	182

---

Realised compound yield	184
The interest rate risks associated with bonds	185
Reinvestment risk	186
Price risk of bonds	186
Duration and convexity as measures of price risk	186
Convexity, an added dimension to price risk	190
Estimating the effects of a change in yield upon price	191
Properties of duration	193
Properties of convexity	193
Problems with duration and convexity	193
<b>9 Futures Contracts and Forward Contracts</b>	<b>196</b>
Introduction	196
The futures contract as a standardised contract	196
The type and quantity of the underlying asset	196
The method of delivery	197
The time of delivery	197
Minimum price movements	197
The clearing house and the operation of the margining system	198
The pricing of forwards and futures – general principles	199
The cash and carry arbitrage	199
The concept of basis	202
Time spreads of forward and futures prices	202
Expectation and the price of forwards and futures on carryable assets	203
Currency futures	203
Pricing of currency futures	203
Futures of equity indices	204
Pricing of equity index futures	205
Empirical evidence of equity index futures pricing	206
Bond futures	207
Types of bond futures and contract specifications	207
Special features of bond futures contracts	208
A variety of deliverable bonds	208
Conversion factors	209
Futures cash equivalent	210
The pricing of bond futures contracts	210
Summary of bond futures pricing procedure	211
Which bond is cheapest to deliver?	211
Calculating the cost of carry	213
Basis and bond futures	215
The convergence of basis	216
Embedded options and the fair price of a bond future	216
Option to choose the bond to be delivered: the quality option	217
The option to choose the delivery day: the timing option	217
The effect of the embedded options on bond futures pricing	218
Futures contracts on interbank deposit interest rates	219

The contract specifications and delivery system	219
The day count conventions	220
Pricing interest rate futures on interbank deposits	220
Forward interest rates and expectations	221
Forward rate agreements (FRAs)	222
The differences between forward and future prices	223
<b>10 Option Pricing Theory</b>	<b>228</b>
An intuitive introduction to options	228
Buying a call	228
Writing a call	230
Buying a put	230
Writing a put	230
Traded options as standardised contracts	230
Limits or boundary conditions for option prices	231
Intuitive explanation of factors influencing option values	232
Asset price (S) and exercise price (X)	232
The time to maturity ( $T - t$ )	233
The rate of interest ( $r$ )	233
The volatility of the underlying security ( $\sigma$ )	233
Valuation of European options	234
The assumptions of the binomial and Black-Scholes models	234
The binomial option pricing model	234
Problem 1: the number of options to sell	236
Problem 2: the fair price	236
The multi-period binomial model	238
Stage 1: use expiration values to calculate values of third time period	241
Stage 2: use third period values to calculate second period values	241
Stage 3: use second period values to calculate first period values	241
Stage 4: use first period values to calculate current option price	242
The Black-Scholes option pricing model	242 ✓
An example of Black-Scholes pricing	242
Black-Scholes applied to equities paying dividends	243
Black-Scholes applied to options on spot equity indices	244
Black-Scholes adapted for equity index futures	245
The Black-Scholes model applied to European options on currencies	245
Options on the spot currency	245
Options on forward currency	246
Option price sensitivities	247
The option delta	247
The gamma of the option	249
The rho of an option	249
The theta of an option	249
The vega of an option	250
The sensitivities of a put option	251 ✓

Put-call parity	252
Valuation of American options	253
Models for valuing American options	255
The binomial model applied to American options	255
Calculation of asset price volatility	257
An example of the calculation of historical volatility	257
Implied volatility – the consensus view	258
Empirical tests of option pricing models	259
Empirical tests of the diffusion process	260
Options on debt instruments and interest rates	260
Are interest rate options different to other options?	260
Options on interest rate and bond futures	261
Valuation of futures margined American options traded on LIFFE	262
Valuation of premium paid American options on short-term interest rate futures	262
Term structure based option pricing models	263
<i>Appendix 1</i> The standardised normal distribution	267
<b>11 Valuation of Bonds with Embedded Options or Floating Coupons</b>	268
Introduction	268
Bonds with embedded options	268
The nature of debt instruments with embedded options	268
Bonds with call provisions	269
Bonds embodying put options	269
Mortgage backed securities	270
Convertible and exchangeable bonds	271
Bonds with equity warrants attached	271
The valuation of bonds with embedded interest rate options	272
Option adjusted analysis of bonds with embedded interest rate options	273
Stage 1: derivation of the term structure of interest rates	274
Stage 2: specifying the stochastic process of interest rates	274
The Black-Derman-Toy model	275
Stage 3: identify security specific information	279
Stage 4: derive the option adjusted cash flows and value the bond	280
Stage 5: analysis of option adjusted yield spread, duration and convexity	282
The option adjusted spread	282
The risks of bonds with embedded options	283
Option adjusted duration	284
Option adjusted convexity	286
Mortgage backed securities	287
Mortgage pass-through securities	287
The price behaviour of mortgage pass-throughs	289
Collateralised mortgage obligations (CMOs)	291

Stripped mortgage backed securities	291
Principal only (PO) strips	292
Interest only (IO) strips	293
The valuation of bonds with embedded equity options	294
Convertible and exchangeable bonds	294
Valuing floating rate notes	295
Risks associated with FRNs	298
<b>12 Equity Portfolio Management</b>	<b>302</b>
Introduction	302
Index matching equity portfolios	303
The rationale for index matching	303
The techniques of matching indices	306
Full replication	306
Stratified sampling	307
Optimised sampling	309
Is one technique better than another?	309
Variation on the index matching theme	311
Tilted funds	311
Completeness funds	313
Bespoke funds	313
The management of index matching portfolios	313
The choice of index to track	314
Purchasing the stocks	316
Daily administration	317
Rebalancing the portfolio	317
Rebalancing due to tracking error	318
Rebalancing due to asset allocation decisions	319
The integration of index matching with active management	319
Active quantitative equity management	321
Forecast based portfolio strategies	321
<b>13 Bond Portfolio Management</b>	<b>327</b>
Introduction	327
Active bond management	327
Bond swaps	327
Swaps in anticipation of a change in the level of interest rates	327
Swaps in anticipation of a change in the slope of the yield curve	328
Swaps in anticipation of a change in the curvature of the yield curve	330
Anomaly swaps	332
Passive bond management	335
Index matching bond portfolios	335
Indexing methodology	335
Bond management strategies for liability funding	336
Classical immunisation	336
Sloping yield curves	338

Non-parallel shifts	338
Convexity	339
Bonds with embedded options	339
Managing an immunised portfolio	339
Multi-period immunisation	340
Dedication or cash matching	341
The stream of liabilities	341
Portfolio composition	342
Horizon matching	342
Contingent immunisation	343
High yield bonds	345
Introduction	345
Default risk	345
The role of high yield bonds in portfolios	347
<b>14 Futures in Portfolio Management</b>	<b>351</b>
Introduction	351
Managing market risk with futures	351
Managing equity market risk with equity index futures	351
Hedging all market risk, reducing portfolio beta to zero	352
Which futures contracts for which instruments?	352
Derivation of the hedge ratio, $h^*$	353
Calculating the number of contracts to sell	354
Tailing the hedge	354
Increasing the beta of the portfolio	356
Partial reduction of beta	356
Managing the futures position	357
Separating currency risk from equity market risk in asset allocation	357
Managing interest rate risk	358
Hedging the interest rate risk of the cash component of a portfolio	358
Cross hedging	360
Hedging the interest rate risk of short-term floating rate notes	361
Hedging interest rate risk in bond portfolios	362
Calculating the hedge ratio, $H^*$	363
Immunitisation using bond futures	366
Anticipatory hedges	368
Creating synthetic index funds	369
Synthetic index funds	369
Synthetic bond index funds	370
Arbitrage between the future and the underlying asset	372
Equity index arbitrage	372
Portfolio insurance	373
Using futures to replicate options in portfolio insurance	373
Caveats on option replication	375
Spread trading using futures	376
Cross currency spreads in bonds futures	377
Relative interest rate sensitivity	377

Relative contract sizes	378
The exchange rate	378
Cross currency spreads in money market futures	378
Yield curve spreads in the same currency	379
<b>15 Options in Portfolio Management</b>	<b>382</b>
Introduction	382
Buying options	383
Calls and puts as highly geared plays on price movements	383
Buying calls as a defensive purchase of an asset	384
Buying puts as portfolio insurance	385
Strategies to reduce the cost of insurance	387
Buying calls to protect profits	387
Buying calls to anticipate cash flow	388
Selecting which options to buy	388
Managing a purchased option position	390
Action upon a change in the price of the underlying security	390
Option writing	391
Call option writing	391
Put option writing	393
When to write options	393
At what exercise price?	394
What maturity?	394
Evaluating option writing strategies	394
Maximum potential return	395
Return if exercised	395
Standstill return	396
Protective action for written options	396
Protective action due to a rise in the asset price	397
Protective action due to a fall in the asset price	397
Option strategies involving combinations of options	398
Vertical spreads	398
Calendar spreads	400
Diagonal spreads	401
Volatility strategies	402
Synthetic forwards	404
Options strategies in interest rate and currency risk management	405
Interest rate risk	405
Caps and floors	405
Caps	405
A floor	406
A collar	406
The cylinder option	408
<b>16 Performance Evaluation</b>	<b>411</b>
Introduction	411
Portfolio objectives revisited	411

---

The choice of benchmark	412
Measuring returns	413
The money weighted rate of return	414
The time weighted return	415
The benchmark returns	415
Returns attribution	416
Returns attribution within a multi-factor framework	416
Measurement of portfolio risk	418
Measures of portfolio performance	419
Summary statistics of performance	420
Excess return to volatility	421
Excess return to beta	422
Portfolio alpha	423
Using regression analysis in performance evaluation	423
Evaluating the investment decision making process	424
Caveats regarding risk adjusted performance evaluation	425
Measuring performance of portfolios incorporating derivatives	426
Asset exposure and returns attribution when using derivatives	426
Performance of portfolios with options	428
<i>Index</i>	431
