Contents

Preface v

CHAPTER 1
Computer Systems – Past, Present & Future
H.J. Sips 1
1. Introduction 1
2. A bit of history 1
3. The basic computer structure 6
4. The influence of advances in technology 11
5. Current and future developments 18
6. Further reading 28
References 28

CHAPTER 2
Programming Languages
H.E. Bal and D. Grune 31
1. Introduction 31
2. Algorithmic languages 41
3. Object-oriented languages 58
4. Functional languages 63
5. Logic languages 70
6. Parallel and distributed languages 76
7. Real-time languages 84
8. Literature 87
Acknowledgements 88
References 88

CHAPTER 3
Operating Systems – The State of the Art
A.S. Tanenbaum 91
1. What is an operating system? 91
2. A brief history of operating systems 93
3. An example operating system – UNIX 97

4. Network operating systems 103
5. Distributed operating systems 111
6. Suggested readings 129
References 129

CHAPTER 4
Databases and Database Management
G. Vossen 133
1. Introduction 133
2. Relational databases 148
3. Transaction management 168
4. Current directions 179
Acknowledgements 186
References 186

CHAPTER 5
Software Engineering
R.T. Yeh, M.M. Tanik, W. Rossak, F. Cheng and P.A. Ng 195
1. Introduction and historical background 195
2. The software life cycle 198
3. Elements of software development methodology 206
4. Language issues 221
5. CASE 225
6. Alternative paradigms for software evolution 229
References 240
Additional reading 243

CHAPTER 6
A Survey of Matrix Computations
C. Van Loan 247
Preface 247
1. Some tools of the trade 249
2. A catalog of matrix factorizations 265
3. High performance matrix computations 293
Acknowledgement 313
References 314

CHAPTER 7
Fundamental Algorithms and Data Structures
J. van Leeuwen and P. Widmayer 323
1. Introduction 323
2. Dictionaries 329
3. Priority queues 347
4. Set union algorithms 359

5. Concluding remarks 367
Acknowledgements 369
References 369

CHAPTER 8
Design (with Analysis) of Efficient Algorithms
D. Gusfield 375
1. Introduction 375
2. Maximum network flow on a sequential machine 376
3. Ford–Fulkerson leads 'naturally' to Dinits 381
4. The breakdown of phases: Goldberg's preflow-push algorithm 391
5. Parametric flow: The value of amortizing across phases 397
6. Computing edge connectivity: The amortization theme writ small 402
7. Matching: Optimal, greedy and optimal-greedy approaches 406
8. Parallel network flow in $O(n^2 \log n)$ time 412
9. Distributed algorithms 416
10. Many-for-one results 419
11. The power of preprocessing: The least common ancestor problem 426
12. Randomized algorithms for matching problems 429
13. A matching problem from biology illustrating dynamic programming 438
14. Min-cost flow: Strong versus weak polynomial time 440
15. Weighted node cover: Approximation algorithms based on network flow 445
16. Summary and thesis 448
Acknowledgement 451
References 451

CHAPTER 9
Computational Complexity
L.J. Stockmeyer 455
1. Overview 455
2. Basic definitions 458
3. NP-complete problems 471
4. Coping with NP-complete problems – Related theory 484
5. The world beyond NP 489
6. Approaches to the P vs. NP question 503
7. Parallel computation 506
Acknowledgement 512
References 513

CHAPTER 10
Computer System Models
I. Mitrani 519
1. Introduction 519

2. Priority scheduling strategies 520
3. Processor-sharing strategies 528
4. Achievable performance in single-server systems 535
5. Interactive virtual memory systems 543
6. Secondary storage devices 550
References 559

CHAPTER 11
Mathematical Programming Systems
J.A. Tomlin and J.S. Welch 561
1. Introduction 561
2. The standard optimizer interface 562
3. Model description languages 569
4. MPS modeling concepts 578
5. Practical implementations of the simplex method 580
6. Interior point methods 587
7. Special structure linear programs 593
8. Nonlinear programming 594
9. Integer programming 595
10. Conclusion 598
References 598

CHAPTER 12
User Interfaces
C.V. Jones 603
1. Overview 603
2. Framework for OR projects 605
3. Human information processing capabilities 609
4. User interface theory, design and implementation 612
5. Hardware 629
6. Software 633
7. User interfaces and OR 640
8. Decision support systems 647
9. Modeling languages for mathematical programming 650
10. Future directions for user interfaces 655
References 656
Surveys on user interfaces 668
