CONTENTS

Preface .................................................................................................................. vii

PART I QUANTITATIVE MODELS FOR PORTFOLIO ANALYSIS

Chapter 1 Quantitative Approach to Asset Allocation .............. 1
  1. The aim of this book (1) 2. Demand for variability
     and for quants portfolio construction system (3)
     3. Modern portfolio theory (MPT) and quants (9)

Chapter 2 Empirical Features of Financial Returns .............. 15
  1. Introduction (15) 2. Random walk and
     nonnormality (19) 3. Nonindependent and
     nonlinear features of a return process (24)

Chapter 3 Univariate Financial Time Series Models .............. 33
  1. Modelling financial time series (33)
     2. Stationarity, trend and return (35)
     3. Taylor model (41) 4. ARCH model (44)
     5. Some other nonlinear models (51)

Chapter 4 Multivariate Financial Time Series Models .......... 58
  1. Multifactor models (58) 2. A review on some
     basic multivariate time series models (59)
     3. State space approach and Kalman Filter model (65)
     4. Some special multifactor models (75)

Chapter 5 MTV Model and Its Applications ......................... 83
  1. Introduction (83) 2. Theoretical foundation
     of MTV model (84) 3. How to use the MTV model and
     estimation (90) 4. MTV exchange rate analysis (95)
     5. Prediction of stock prices (101)

PART II QUANTITATIVE ASSET ALLOCATION SYSTEMS

Chapter 6 Quantitative Portfolio Construction Procedures ...... 108
  1. A comprehensive asset allocation (108)
     2. Basic notation and concept (113)
     3. Markowitz theory and its implications (116)
     4. Mathematical structure of asset allocation (123)

Chapter 7 Multifactor Models and their Applications ............. 130
  1. Introduction (130) 2. CAPM (131) 3. APT
     (Arbitrage pricing theory) (139) 4. Two multifactor
     models in Japan (146) 5. Regression-MTV model (152)

Chapter 8 B. Rosenberg Models and their Applications .......... 159
  1. Market model portfolio (159) 2. Time-varying
     coefficient models (162) 3. Prediction of future
     returns and risk (164) 4. A model in Japan (169)
     5. Convergent parameter model (174)
Chapter 9 Selection of Portfolio Population .................................. 177
1. Introduction (177) 2. Information coefficient
   (IC) for selection of a portfolio population (179)
3. Classification procedure (181) 4. Robust
   classification analysis (189)

Chapter 10 Optimal MTV Market Portfolio ..................................... 195
1. MTV-MP system (195) 2. Extraction of
   common market components and selection of a target
   population (196) 3. Optimal MTV portfolio (200)
4. Prediction errors in MTV model (203)

Chapter 11 Index Portfolio and Canonical
   Correlation Portfolio ...................................................... 205
1. Basic concept of index portfolio (205)
2. MTV Index portfolio (207) 3. Cluster analysis
   for grouping (209) 4. Index plus α premium minus
   β risk historical portfolio (212) 5. Canonical
   correlation portfolio (215)

PART III STATISTICAL APPROACH TO OPTION PRICING AND BOND PRICING

Chapter 12 Black-Scholes Option Theory and
   Its Applications ............................................................. 220
1. Introduction (220) 2. Black-Scholes option
   pricing formula (224) 3. Basic formulae for BS
   option portfolios (231) 4. Portfolio insurance (235)
5. Estimation of volatilities (239)

Chapter 13 Practical Option Pricing and Related Topics ................. 242
1. Practical option pricing (242) 2. Gram-Charlier
   option pricing (245) 3. Practical option pricing
   under a Taylor model and under an ARCH model (249)
4. Fractional Brownian motion and option pricing (254)
5. Asian options (260)

Chapter 14 Statistical Bond Pricing Models .................................. 263
1. Introduction (263) 2. Basic structure of bond
   analysis (264) 3. Market spot rate function (266)
4. Market spot rate function of zero coupon bond (270)
5. Statistical model for market discount function of
   coupon bonds (275) 6. Prediction of market discount
   function (278) 7. Duration in our statistical models (278)

Appendix .......................................................................................... 283
References ....................................................................................... 295
Index ................................................................................................. 305
