Introduction	1
1 Linear regression models	7
1.1. Some properties of matrices	7
1.2. Linearly parametrized regression models	12
1.3. L_2 estimators of parameters	15
1.4. The Gauss-Markov theorem	23
1.5. Basic statistical properties of the estimator $\hat{\vartheta}_W$ in a regular model	25
1.6. Variance-minimizing optimal experimental designs	29
2 Linear methods in nonlinear regression models	34
2.1. Symbols for derivatives	34
2.2. Intrinsically linear regression models	36
2.3. Statistical inference in intrinsically linear models	41
2.4. Linear approximations of nonlinear regression models	43
2.5. A test of linear or intrinsically linear models against a nonlinear alternative	48
2.6. Confidence regions for ϑ obtained by linear methods	53
3 Univariate regression models	55
3.1. The model and its geometric properties	55
3.2. L_2 estimators of ϑ	61
3.3. Statistical properties of the maximum likelihood estimator	66
4 The structure of a multivariate nonlinear regression model and properties of L_2 estimators	80
4.1. Regular and singular models	80
4.2. Geometrical properties of a regular regression model — the curvatures of the model	85
4.3. Properties of singular regression models: the regression model as a differentiable manifold	95
4.3.1. The case of a singular matrix W	95
4.3.2. The case of a low rank of the matrix $J(\vartheta)$	97
4.4. The existence and uniqueness of L_2 estimator	101
5 Nonlinear regression models: computation of estimators and curvatures	113

5.1. Iterative computation of L_2 estimators	113
5.2. The Gauss-Newton method in a regular model	117
5.3. Other methods	121
5.3.1. The gradient method	122
5.3.2. Newton's method	122
5.3.3. Quasigradient methods	123
5.3.4. The GN method when the matrix $J(\vartheta)$ is rank-deficient	124
5.3.5. The Levenberg-Marquardt method for ill-conditioned models	124
5.4. Computation of orthonormal bases of tangent and ancillary spaces	125
5.5. Curvature arrays	129
6 Local approximations of probability densities and moments of estimators	131
6.1. Asymptotic properties of estimators: first-order local approximations	131
6.2. Second-order local approximations: approximate moments of L_2 estimators	140
7 Global approximations of densities of L_2 estimators	154
7.1. Approximate probability density of estimator $\hat{\vartheta}_W$ on the interior of the parameter space	154
7.2. Probability distribution of estimator $\hat{\vartheta}_W$ on the boundary of the parameter space	171
7.3. Probability density of the posterior modus density estimator	177
7.4. Probability density of $\hat{\vartheta}_C$ for $C \neq W$	179
7.5. The probability density of the estimator when the error distribution is not normal	182
7.5.1. The case of elliptically symmetrical errors	182
7.5.2. The use of mixtures of error distributions	184
7.6. The use of the Riemannian curvature tensor in improved approximate densities	185
7.7. Conditional probability density of the estimator	188
8 Statistical consequences of global approximations especially in flat models	192
8.1. Models with a zero Riemannian curvature tensor: flat models	192
8.2. Pivotal variables and confidence regions for ϑ in flat models	195
8.3. On confidence regions for ϑ in general nonlinear regression models	200
8.4. Remarks on estimators of the parameter σ in nonlinear regression	206

8.5. On optimum experimental design in nonlinear regression models	209
8.5.1. The approach based on the asymptotic normality	210
8.5.2. The sequential approach	211
8.5.3. Design of experiments based on the probability density	212
9 Nonlinear exponential families	215
9.1. Regular exponential families	215
9.2. Geometry of nonlinear exponential families induced by the maximum likelihood estimator	224
9.3. The saddle-point approximation of the probability density in the covering family	231
9.4. Approximate probability density of the maximum likelihood estimator in nonlinear exponential families	236
9.5. Notes on differential geometry in mathematical statistics	241
References	248
Basic symbols	255
Subject index	258
