List of Figures and Tables	vii
Preface	xi
Contributors	xii
1 Introduction The Editors	1
PART I BACKGROUND	
2 The Greenhouse Effect: Its Causes, Possible Impacts, and Associated Uncertainties Stephen H. Schneider and Norman J. Rosenberg	7
3 Human Development and Carbon Dioxide Emissions: The Current Picture and the Long-Term Prospects Joel Darmstadter and Jae Edmonds	35
4 Sea-Level Rise: Regional Consequences and Responses Gjerrit P. Hekstra	53
5 Climate Change: Problems of Limits and Policy Responses Pierre R. Crosson	69
6 Assessing and Managing the Risks of Climate Change Paul R. Portney	83
PART II NATURAL RESOURCE SECTORS	
7 Adapting Future Agriculture to Changes in Climate William E. Easterling III, Martin L. Parry, and Pierre R. Crosson	91
8 Climate and Forests Roger A. Sedjo and Allen M. Solomon	105
9 The Biological Consequences of Climate Changes: An Ecological and Economic Assessment Sandra S. Batie and Herman H. Shugart	121

10	Water Resources and Climate Change	133
	Kenneth D. Frederick and Peter H. Gleick	

PART III PERSPECTIVES

11	Potential Strategies for Adapting to Greenhouse Warming: Perspectives from the Developing World	147
	N. S. Jodha	
12	Human Dimensions of Global Change: Toward a Research Agenda	159
	Ian Burton	
13	Thoughts on Abatement and Adaptation	167
	Roger R. Revelle	
14	Epilogue	175
	Chester L. Cooper	

List of Figures and Tables

FIGURES

- 2-1 Schematic illustration of the earth's radiation and energy balances. **8**
- 2-2 Cumulative surface warming from assumed trace gas scenario. (Period fifty years from 1980 levels.) **9**
- 2-3 Geographical distribution of surface air temperature change under conditions of ($2 \times \text{CO}_2$) – ($1 \times \text{CO}_2$) by 2030 for winter. **13**
- 2-4 Geographical distribution of surface air temperature change under conditions of ($2 \times \text{CO}_2$) – ($1 \times \text{CO}_2$) for summer. **14**
- 2-5 Geographical distribution of the precipitation rate change under conditions of ($2 \times \text{CO}_2$) – ($1 \times \text{CO}_2$) for winter. **15**
- 2-6 Geographical distribution of the precipitation rate change under conditions of ($2 \times \text{CO}_2$) – ($1 \times \text{CO}_2$) for summer. **16**
- 2-7 July soil moisture change for $2 \times \text{CO}_2$ minus control simulations for five different general circulation models. **17**
- 2-8 Frequency distribution of actual and modeled daily average surface air temperature in the Great Plains in January, April, July, and October. **20**
- 2-9 Global surface air temperature calculated from land stations over the past century. **21**
- 2-10 The relative fraction of spruce pollen and oak pollen in eastern North America today and at the end of the last Pleistocene (Ice Age). **22**
- 2-11 Average wheat yields and acreage abandonment in the Great Plains states for 1925–69 and 1967–85. **23**
- 2-12 Palmer Moisture Anomaly Index (PMAI) for the contiguous United States in August 1936, August 1956, and August 1976. **24–25**
- 2-13 Palmer Drought Severity Index for the contiguous United States as of September 3, 1988. **26**
- 3-1 CO_2 emissions from fossil fuel combustion by major world regions, 1950–1986. **39**
- 3-2 Total global CO_2 emissions from fossil fuel combustion, 1950–1986. **39**
- 4-1 Holocene shoreline changes in the North Sea region, showing approximate shoreline positions for 10,000 B.P. to 10,300 B.P.; 8700 B.P.; and 7800 B.P. **54**
- 4-2 Regional averages of annual sea-level anomaly at sites in six regions around the world, 1880–1980. **55**
- 4-3 The effect of variations in wind speed and wind direction on the high-tide level at Wilhelmshaven, West Germany. **57**
- 4-4 Location of official transmigration projects in the tidal wetlands of Indonesia. **59**
- 4-5 Areas of the world vulnerable for one reason or another to a rising sea level. **60**
- 4-6 European areas vulnerable to a rising sea level. **61**
- 4-7 The analytical framework used by Delft Hydraulics Laboratory to describe the effects of sea level rise on society. **62**
- 4-8 Cost issues for management of rising sea level. **64**

- 5-1 Hypothetical paths of world income with and without global warming and related climate change, case 1. **70**
- 5-2 Hypothetical paths of world income with and without global warming and related climate change, case 2. **72**
- 7-1 Farm-level decision framework. **92**
- 7-2 Present-day regional analogues of the Goddard Institute for Space Studies (GISS) $2 \times \text{CO}_2$ climate estimated for six regions: Saskatchewan, Iceland, Finland, Leningrad, Cherdyn (USSR), and Hokkaido and Tohoku (Japan). **96**
- 7-3 Safely cultivable area for irrigated rice in northern Japan under four climate scenarios. **97**
- 8-1 An area approximately equal to the 465 million hectares of newly planted forest that would remove the 2.9 Gt of carbon added annually to the atmosphere. **114**
- 9-1 Response of three tree taxa over the past 15,000 years to changes associated with recession of continental glaciers of ice ages. **123**
- 9-2 Environmental disturbance regimes, biotic responses, and vegetational patterns viewed in the context of space-time domains. **124**
- 9-3 Changes in potential vegetation of the world under the temperature change predicted by Manabe and Stouffer (1980) for the climate under a CO_2 doubling. **126**

TABLES

- 2-1 Projections of Climatic Changes Likely to Occur as the Result of an Equivalent Doubling of Atmospheric CO_2 **11**
- 2-2 Changing Odds of a Heat Wave in Selected Cities if Mean Temperature Increases by 3°F (1.7°C) **18**
- 2-3 Standard Deviation (SD) of Current Daily Temperature ($^\circ\text{C}$), Modeled SD Under Current Conditions, and Changes in SD Predicted for the Future in Four U.S. Regions **18**
- 2-4 Standard Deviation (SD) of Current Daily Precipitation (mm/day), Modeled SD Under Current Conditions, and Changes in SD Predicted for the Future in Four U.S. Regions **19**
- 2-5 Simulated Effects of Greenhouse-Induced Climate Change and CO_2 -Enrichment-Induced Plant Responses on Evapotranspiration in a Wheat Field, Grassland, and Forest **30**
- 3-1 Annual Emissions Budget Estimates for Seven Radiatively Important Gases **37**
- 3-2 Average CO_2 Emission Coefficients by Fuel **38**
- 3-3 Assumptions Underlying Reference Case Emissions Determination **41**
- 3-4 Reference Case Forecast **42**
- 3-5 Uncertainty Range in Global Fossil Fuel CO_2 Emissions, 2000–2075 **42**
- 3-6 Demographic, Economic, Energy, and CO_2 Data for 1985 and for Alternative Scenarios in 2050 **43**
- 3-A-1 Sources, Sinks, and Atmospheric Parameters for Seven Radiatively Important Gases **50**
- 8-1 Forested Area and Stored Carbon: Current and Future by Holdridge Life Zones **111**

List of Figures and Tables

- 8-2 Areas of New or Rapidly Growing Forest Lands Required to Stabilize Atmospheric Carbon Dioxide at Current Levels **114**
- 10-1 Effect on Runoff of Climate Changes in Arid and Semiarid Basins **134**
- 10-2 Decadal Reservoir Storage Capacity per Unit Volume of Dam for the 100 Largest Dams in the United States **135**
- 10-3 Indicators of Vulnerability to Climatic Conditions **141**
- 11-1 Likely First-Order Impacts of Changes in Climate and Other Variables on the Agricultural Resource Base and Production Environment **148**
- 11-2 Likely Second-Order Impacts on Components and Features of Farming Systems if the Resource Base and Production Environment Are Affected by Climate Change **149**
- 11-3 Likely Third-Order Impacts on Macrolevel Agricultural Systems and Activities if Components of Farming Systems Are Affected by Climate Change **149**
- 11-4 Some Distinguishing Features of Agricultural Sectors in Developing Countries and Their Implications for Greenhouse Warming Impacts and Adaptations to Them **150**
- 11-5 Framework for Assessing or Developing Potential Options for Adaptation to the Climatic Impacts of Greenhouse Warming **152**
- 11-6 Approximate Time in Years for Societal Response to First-, Second-, and Third-Order Impacts on Agriculture **153**
- 11-7 Responses to Physical-Biological Changes (Some examples from India of adaptations to a declining agricultural resource base and deterioration of the production environment broadly comparable to the potential negative impacts of greenhouse warming) **154**
- 11-8 Responses to Precipitation Changes (Some examples from India . . .) **155**
- 11-9 Responses to Changes in the Resource Base (Some examples from India . . .) **156**
- 11-10 Responses to Changes Related to Marginal Areas and Marginal Populations (Some examples from India . . .) **157**
