

PART I

CHAPTER I.1

A TARGET-BASED, LEAST COST APPROACH TO CLIMATE STABILIZATION

- A. Introduction1-1
- B. Growing Awareness of the Climate Threat ...1-5
- C. Driving Forces of Climate Change1-8
- D. Greenhouse Risks and Consequences:
Just Warmer Weather?1-15
- E. Analytic Framework for the Prevention
Paradigm1-20

CHAPTER I.2

IS CLIMATE STABILIZATION STILL FEASIBLE?

- A. Overview.....2-1
- B. Climate modeling approach2-1
- C. How Much Warming is Already Locked
in from the Past?2-6
- D. What Further Warming will Future
Emissions Bring?2-10
- E. From Concentration Ceilings
to Policy Targets.....2-28

CHAPTER I.3

CONTROL REQUIREMENTS FOR NON-FOSSIL GREENHOUSE GASES

- A. Overview.....3-1
- B. CFC Releases and Other Urban-Industrial
Emissions.....3-1
- C. Greenhouse Gases and Agriculture.....3-14
- D. Carbon Releases from Deforestation and
Soil Destruction: How Significant Are
They in Climate Warming?3-26
- E. Restoring Biospheric Carbon Pools in
Forests and Soils3-39

CHAPTER I.4

HOW MUCH FOSSIL FUEL CAN STILL BE BURNED?

- A. Overview.....4-1
- B. Concentration Limit for Carbon Dioxide.....4-1
- C. Fossil Reserves, Energy Content, Carbon
Content, and Airborne Fraction.....4-3
- D. Global Fossil Carbon Budget4-7

PART II

CHAPTER I.5

HOW COULD THE GLOBAL CARBON BUDGET BE SHARED?

- A. Climate Change and Global Equity.....5-1
- B. How Could Equity Goals Be Quantified?5-2
- C. Fossil Carbon Emissions and Interregional Equity: The Record to Date5-8
- D. Equity-based Allocation of the Global Carbon Budget5-13
- E. Person-year Equity and Compensatory International Assistance5-16

CHAPTER I.6:

HOW QUICKLY MUST FOSSIL FUELS BE PHASED OUT?

GLOBAL AND REGIONAL MILESTONES

- A. Introduction6-1
- B. What Rates of Fossil Phase-out Could Be Viable?6-1
- C. Milestones for the Global Fossil Phase-out ...6-7
- D. Are There Any Other Options?6-18
- E. C/GDP Ratios: Historic versus Required Future Changes6-21
- F. Summary and Conclusions6-24

CHAPTER I.7

A GLOBAL COMPACT ON CLIMATE STABILIZATION AND SUSTAINABLE DEVELOPMENT

- A. Climate Stabilization and Sustainable Development.....7-1
- B. International Protocols versus Leadership by Example.....7-3
- C. The Climate Convention.....7-5
- D. Fossil Fuel Protocol7-8
- E. Protocol on Reforestation and Agricultural Land-Use7-9
- F. Protocol on Chlorofluorocarbons7-12
- G. Protocol on Other Trace Gases7-12
- H. Conclusion7-12

APPENDIX I.1A-1

APPENDIX I.2A-3

I.1.1	Overview of greenhouse gases in the atmosphere	1-7
I.1.2	Overview of key characteristics of trace gases (1)	1-9
I.1.2	Overview of key characteristics of trace gases (2)	1-10
I.1.2	Overview of key characteristics of trace gases (3)	1-11
I.2.1	Energy use, C-emissions and CO ₂ -concentration for the highest and the lowest scenario	2-11
I.2.2	Trace gas scenarios for equilibrium temperature change calculations	2-12
I.2.3	Additional chlorofluorocarbons considered in this study	2-15
I.2.4	Historic and projected atmospheric concentrations of important trace gases for a range of scenarios.....	2-16
I.2.5	Contribution of trace gases to the past and future greenhouse effect for a range of scenarios.....	2-18
I.2.6	Comparison of historic and future trace gas con- tributions to global equilibrium warming as obtained by different authors and scenarios ...	2-20
I.2.7	Maximum radiative forcing and maximum equivalent-CO ₂ concentrations under a warming limit of 2.5° C, as a function of model climate sensitivity	2-22
I.2.8	Transient surface temperature change T _s (K) for various energy and trace gas scenarios and differ- ent climate sensitivities T _c (K)	2-24
I.2.9	Transient surface temperature change T _s (K) for various energy and trace gas scenarios and different climate sensitivities T _c (K).....	2-24
I.2.10	Ratio of transient and equilibrium warming for climate sensitivity 4.5° C.....	2-26
I.2.11	Equivalent CO ₂ concentrations in the toleration scenario	2-28
I.2.12	Applicability of control measures for trace gases	2-28
I.3.1	Estimates of trace gas emission reduction potentials by individual source or use, and assumed reduction in the toleration scenario ...	3-2
I.3.2	Global Sources for CFC-11 and CFC-12	3-3

I.3.3	Summary of the main CFC-characteristics influencing the ozone layer and the climate	3-5
I.3.4	Global Budget for Nitrous Oxide	3-8
I.3.5	Global budget for nitrogen oxides.....	3-9
I.3.6	Global budget for methane	3-11
I.3.7	Global budget for carbon monoxide	3-13
I.3.8	Methane releases from animal sources by world region.....	3-17
I.3.9	Global budget for carbon dioxide.....	3-28
I.3.10	Carbon in vegetation and soils for different land-uses and regions.....	3-32
I.3.11	World land area by category and use, circa 1982-84	3-33
I.3.12	Annual rates of tropical deforestation and desertification	3-36
I.3.13	Scenario of land-use changes for sequestering atmospheric carbon	3-45
I.3.14	Sequestering of atmospheric carbon through tree planting: rough upper limit estimate	3-50
I.4.1	Energy, tons of carbon, and ppm of carbon dioxide	4-2
I.4.2	Carbon content of global fossil resources.....	4-4
I.4.3	Exhaustion of fossil resources under various carbon budgets	4-6
I.4.4	Carbon dioxide level as a function of carbon release trajectories.....	4-8
I.5.1	Approximate global distribution of energy use and population in 1986.....	5-7
I.5.2	Population forecasts for the world and by regions, 1985-2100.....	5-11
I.5.3	Population dynamics and cumulative person years, 1950-2100.....	5-12
I.5.4	Historic and remaining permissible fossil CO ₂ releases, cumulative per capita equity under a 400 ppm/300 btC ceiling, 1950-2100 and 1985-2100.....	5-15
I.5.5	Illustration of possible equity formulas for the initial capitalization of a global climate protection fund	5-19
I.5.6	Illustration of a possible equity formula for funds contributions from ICs	5-20

- I.6.1 Fossil carbon releases 1985-2100 by world region under various phase-out schedules: 300 btC cumulative budget and 450 btC sensitivity case6-11
- I.6.2 Required fossil carbon reductions, gdp growth, and required changes in C/gdp ratios: industrialized countries6-12
- I.6.3 Required fossil carbon reductions, gdp growth, and required changes in C/gdp ratios: developing countries.....6-13
- I.6.4 Reduction schedules for global fossil carbon releases 300 btC limit and 450 btC sensitivity case6-16

I.6.5	Reduction schedules for fossil carbon releases from industrial countries, 150 btC limit and 225 btC sensitivity case	6-16
I.6.6	Fossil carbon reduction schedules for developing countries, 150 btC budget and 225 btC sensitivity case	6-17
I.6.7	Allocation of the IC fossil carbon budget on the basis of 1986 per capita fossil carbon releases	6-25

I.1.1	History of mean air temperature as inferred from a variety of palaeoclimatic indicators.....	1-14
I.1.2	Climatic throwback from global warming	1-16
I.1.3	Climate stabilization targets: relationship of concentration ceilings, emission paths, and reduction milestones.....	1-25
I.2.1	Global temperature trend obtained from a global climate model for several assumed radiative forcings	2-3
I.2.2	Modeling concept for transient response study.....	2-5
I.2.3	Delay of the equilibrium warming by the ocean.....	2-7
I.2.4	Response in CO ₂ -concentration and global mean transient surface temperature (Ts) relative to 1860 for different climate sensitivities (Te = 1.5 – 4.5 K), if all CO ₂ -emissions had been stopped in 1980	2-7
I.2.5	Calculated trace gas concentration change from 1960–1980, and for the high, medium, and low scenarios given in Table I.2.2 from 1980–2030— for (a) CO ₂ (b) CH ₄ (c) N ₂ O (d) CFC-11 and CFC-12.....	2-14
I.2.6	Global equilibrium warming due to trace gases, 1850–2030 and the effect of the Montreal Protocol.....	2-17
I.2.7	Historic and future contribution of trace gases to global warming for a range of scenarios without CFC-control.....	2-17
I.2.8	Historic and future contribution of trace gases to global warming for a range of scenarios with Montreal CFC-control	2-19
I.2.9	CFC contribution to global warming relative to 1960	2-19
I.2.10	Transient surface temperature change for various scenarios related to different time periods and paleoclimatic conditions.....	2-25
I.2.11	Transient surface temperature change for various scenarios related to different time periods and paleoclimatic conditions.....	2-25
I.3.1	Grain production yields from ecofarming practices in Africa compared to green revolution agriculture yields.....	3-24
I.3.2	The global carbon cycle, mid to late 1980s	3-27
I.3.3	Biospheric and fossil carbon releases under two scenarios (1860–2100)	3-30

I.3.4	Simplified relationship between harvesting and stored carbon on afforested land used for a sustainable-yield forestry	3-47
I.4.1.a	CO₂ concentration—Trajectory A.....	4-9
I.4.1.b	CO₂ concentration—Trajectory B.....	4-9
I.4.1.c	CO₂ concentration—Trajectory C.....	4-10
I.4.1.d	CO₂ concentration—Trajectory D	4-10
I.4.1.e	CO₂ concentration—Trajectory E.....	4-11
I.4.1.f	CO₂ concentration—Trajectory F	4-11
I.4.2	Global carbon and fossil energy budgets under a 400 ppm atmospheric CO₂ limit	4-15
I.5.1	Regional Contributions to Global Warming 1980s (%)	5-4
I.5.2	Regional Contributions to Global Carbon Releases from Fossil Fuel Use and Deforestation 1980s (%)	5-4
I.5.3	Regional Contributions to Fossil Carbon Releases in 1986 (%)	5-4
I.5.4	Global Annual Fossil CO₂ Emissions 1950–1986	5-9
I.5.5	Global Annual Fossil CO₂ Emissions 1950–1986	5-9
I.5.6	Cumulative Fossil CO₂ Emissions 1950–1986	5-9
I.5.7	IC and DC Annual Fossil CO₂ Emissions per Capita 1950–1986	5-10
I.5.8	Regional Annual Fossil CO₂ Emissions per Capita 1950–1986	5-10
I.5.9	Cumulative Fossil CO₂ Emissions per Capita-Year 1950–1986	5-10
I.6.1	Alternative Global Fossil Fuel Phaseout Schedules under a 300 GtC Budget for 1985–2100	6-8
I.6.2	Application of Toronto Target to Industrialized Countries	6-10
I.6.3	Fossil Fuel Phaseout Schedule for Industrialized Countries	6-14
I.6.4	Fossil Fuel Phaseout Schedule for Developing Countries	6-15
I.6.5	Global and Regional Phaseout Schedules	6-20
I.6.6	World energy/GDP and fossil-carbon/GDP ratios 1970–86 (1970=100)	6-22
I.6.7	Evolution of Carbon/GDP ratios by world region 1970–86 (1970=100)	6-23
