<i>List of contributors</i>	xvii
<i>Abbreviations</i>	xix
1. Sources of microorganisms and their preservation	1
<i>David Smith</i>	
1. Introduction	1
Microorganism stability	1
Reasons for maintaining collections	2
Characterization of microorganisms	2
Data storage and retrieval	3
Guidelines for the establishment and operation of collections	3
2. Sources of microorganisms and microbial databases	4
Organizations	4
Databases	6
Microbial resource collections	7
3. Preservation and maintenance	8
Preservation techniques available	8
Adaptations to continuous growth used for preservation	9
Dehydration techniques	11
Cryopreservation	18
Summary	21
References	21
2. Isolation and growth of hyperthermophiles	23
<i>Richard J. Sharp and Neil D. H. Raven</i>	
1. Introduction	23
2. The isolation of hyperthermophiles	23
Geothermal environments	23
Sampling geothermal environments	24
3. Media for the growth of hyperthermophiles	26
Liquid media	26
Preparation of solidified media	28
4. Growth and bioreactors for hyperthermophiles	31
Introduction	31
Continuous culture of <i>Pyrococcus furiosus</i>	32

Contents

Gas-lift reactors	
Biomass yields	32
	35
5. Development of vessels for the study of barophilic hyperthermophiles	41
6. Cryopreservation of hyperthermophiles	42
Introduction	42
7. Culture procedures for hyperthermophiles	45
References	50
3. Design and optimization of growth media	53
<i>Randolph L. Greasham and Wayne K. Herber</i>	
1. Introduction	53
2. Medium design	53
Complex media	54
Chemically defined media	55
3. Nutritional requirements	57
Carbon source	57
Nitrogen source	59
Oxygen	60
Inorganic ions	60
Growth factors	61
4. Inducers	61
5. Non-nutritional components	62
Selective agents	62
Solidifying agents	62
6. Environmental factors	62
7. Medium optimization	64
Full factorial search	65
Statistical search	65
Pattern search	69
Acknowledgement	72
References	73
4. Working with laboratory fermenters	75
<i>Stephen Collins</i>	
1. Introduction	75
2. Laboratory requirements	76
3. Choice of vessel	76

Contents

4. Sterilization	78
5. Aeration and agitation	81
6. Aseptic connections	81
Septum ports	82
Line connections	82
Steam sterilizable connectors	83
7. Inoculation	83
8. Sampling	84
Syringe	84
Hoods	84
Sample valves	85
9. Media	86
Sterilization of large volumes	86
Microbial growth in media supply lines	86
Salt balance	87
10. Process measurement and control	87
pH	87
Dissolved oxygen tension	90
Temperature	92
Foam	93
Dissolved CO ₂	93
Redox	93
Vent-gas analysis	94
Biomass	94
11. Continuous culture	94
Sterilization and the storage of media	94
Control and measurement of flow	95
Measurement and control of volume	95
Interruption of steady state	96
12. Computer data logging and control	96
Typical functions of fermentation software	97
Remote access	97
Alarms	97
What to monitor	98
What to control	98
Example: control of a fed-batch process	98
References	101
Further Reading	101
5. Measurement of biomass	103
<i>Andrew P. Ison and Gavin B. Matthew</i>	
1. Introduction	103

Contents

General remarks	103
What is biomass?	103
Specific and volumetric rates	104
Off-line and on-line measurement	104
2. Chemical methods	104
Bioluminescence and chemiluminescence	104
DNA analysis	107
Fluorescence	108
Near infrared spectroscopy	109
3. Microscopic methods	110
Direct count microscopy	110
Viable cell counts	111
Epifluorescence	113
Image analysis	113
4. Physical methods	114
Dry weight methods	114
Packed cell volume	117
Turbidimetry	118
Nephelometry	120
Electrical counting and sizing	120
Flow cytometry	121
Dielectric permittivity	121
Other techniques	125
5. Mathematical modelling methods	125
Mass balance analysis	125
Mass spectrometry	125
6. Conclusions	126
References	127
Further reading	128
General biomass measurement	128
Chemical methods	129
Microscopical methods	129
Physical methods	129
Mathematical methods	129
6. Fermenter vent-gas analysis	131
<i>Peter M. Salmon and Barry C. Buckland</i>	
1. Introduction	131
2. Methods for vent-gas analysis	131
Thermal conductivity	131
Flame ionization	132
Gas chromatography	132

Contents

Electrochemical sensors	133
Infrared (IR) absorbtion	134
Paramagnetism	136
Mass spectrometry	139
3. Installation and operation	145
Sample probes	145
Sample transport	146
Knock-out pots, coolers, filters, dryers, and absorbers	147
Multistream sample manifolds	148
Pressure, temperature, and flow control	149
Monitoring an analyser system	150
Fermenter pressure, volume, air flow, and dissolved oxygen	151
Data collection	151
4. Calculated variables	152
Well-mixed liquid and gas phases	152
Alternative mixing models	156
Estimation of aqueous concentrations of volatile organic compounds	157
The respiratory quotient	160
References	162
7. The analytical chemistry of microbial cultures	165
<i>David M. Mousdale</i>	
1. Introduction	165
The analytical approach to microbial fermentations	165
General aspects of methodology	166
Sampling and sample monitoring	166
2. The utilization of inputs	166
Carbohydrates	166
Oils	170
Nitrogen sources	170
Phosphate and other inorganic anions	175
3. The accumulation of fermentation metabolites	178
Product and side-products	178
Products of carbohydrate metabolism	178
Amino compounds	180
Ammonia	180
Peptides, proteins, and enzymes	181
Thiol compounds	183
Other common metabolites	184
Carbon dioxide	185
Pigments	185
4. The insoluble phase (biomass and pelletable material)	185
Biomass measurement in complex media	185

Contents

Biomass (pellet) composition	188
Biomass compositions and elemental analyses	189
5. Carbon and nitrogen mass balances	189
References	191
8. Analysis of microbial growth data	193
<i>Michael J. Bazin, Ann P. Wood, and David Paget-Brown</i>	
1. Introduction	193
Definitions	193
Kinetic functions	195
Culture systems	197
2. Parameter estimation	197
Estimation of Monod growth constants from steady-state chemostat data	198
The 'washout' method	199
Growth yields	201
3. Simulation	202
Numerical solution of differential equations	204
Dynamic parameter estimation	205
4. Analytical methods	208
References	211
9. Metabolic flux analysis	213
<i>William H. Holms</i>	
1. Introduction	213
Basic principles	213
Definitions and units	214
The central metabolic pathways (CMPs)	214
Components of the CMPs	216
2. Flux analysis of <i>E. coli</i> ML308 growing on glucose, pyruvate, or fumarate as sole sources of carbon	219
The data	219
Construction of a flux or throughput diagram	222
3. Interpretation of flux analysis	231
Fluxes in CMPs must balance one another	231
What does acetate excretion tell us?	231
4. Intervention to modulate acetate excretion	232
Intervention by restriction of feedstock uptake	232
Intervention by enzyme inhibition	234

Contents

Intervention by deletion of acetate excretion mechanism	234
Intervention to improve position of precursors	234
Other means of diminishing acetate excretion	239
Conclusions	239
5. What controls flux?	239
Theories	239
Determination of flux—a statement of the obvious	241
6. Applications of flux analysis in the real world	245
7. Conclusions	246
General	246
<i>E. coli</i> ML308	246
Control of CMPs	246
References	247
A1. List of suppliers	249
A2. Addresses of culture collections, microbial databases, and national and international culture collection organizations	253
