

Contents

1. Introduction	1
2. Theoretical considerations	2
3. The data source	4
4. The capital stock at replacement costs: A new algorithm	4
4.1. A short review of the literature	5
4.2. A new algorithm	9
4.3. A comparison of the different approaches	15
4.4. Estimates of the capital stock	16
5. The Calculation of Q	19
5.1. An Overview of empirical work using the direct forecasting approach	19
5.2. The Calculation of Q using firm-level balance sheet data	22
6. Empirical Results	27
6.1. Descriptive evidence	27
6.2. Estimated Q -investment functions	29
6.3. Results for classes of firm size	31
7. Conclusion	32
Appendix	34
References	40

List of Tables

Figure 1: The retirement function for average lifetimes of 5 and 10 years	11
Figure 2: Distribution of errors for the different algorithms	16
Figure 3: Sum of calculated capital stocks at replacement values	17
Figure 4: Level and dispersion of the capital stock	17
Figure 5: Estimates by proportional expansion through sales	18
Figure 6: Kernel-density estimations for the estimated Q_s	27
Figure 7: Kernel regression: $I/K = f(I/K_{-1})$	28
Figure 8: Kernel regression: $I/K = f(Q^a)$	28
Figure 9: Kernel regression: $I/K = f(Q^m)$	28

List of Figures

Table 1: Descriptive statistics of the estimated Q_s	27
Table 2: Descriptive statistics for class sizes	31
Table 3: Average Q investment functions for class sizes	32
Table 4: Marginal Q investment functions for class sizes	32
