

Preface

This book originated from the 8th ELSNET Summer School on Language and Speech Communication that was held in the summer of 2000 on the island of Chios in Greece. ELSNET is the European Network in Human Language Technologies, a network of some 140 academic institutions and private companies from all over Europe, all active in language and speech technology, covering the whole range from basic research to industrial development and integration. It was created in 1991 with the objective to bring together the language and speech technology communities on the one hand, and the academic and industrial communities on the other.

The ELSNET Summer Schools have now become a tradition. They are different from other summer schools in that they are always dedicated to one specific topic area, always on the borderline of language and speech technology. They bring together a mixed audience of academic and industrial researchers, with backgrounds in language processing, speech processing, software engineering, and many other fields.

The topic selected for the 2000 Summer School was “Text- and Speech-Triggered Information Access.” The underlying problem is well-known to all of us: we are continuously producing and storing enormous amounts of data in many different forms (such as text, speech, images, mixed modalities) – how can we ensure that these vast data collections remain accessible in an efficient and natural way?

The problem has of course many facets other than just accessibility, such as physical storage, data integrity, data acquisition, intellectual property rights and data management, but this Summer School focused on how language and speech technology can be deployed to get access to information.

We have found our Summer Schools to be an effective and efficient instrument for the transfer of knowledge. At the same time it should be noted that they can only accommodate a limited number of people, in a specific location, at a specific moment in time. In order to make the same knowledge accessible to a wider audience than just the happy few who were able to attend the School, we have adopted the policy of trying to transform the material taught at the School into a book. This book is the fifth ELSNET Summer School book, and the first one to be published in Springer-Verlag’s LNCS Tutorials series.

The book attempts to give newcomers in the field a clear overview of the main technologies and problems and to give existing practitioners a concise review of the technologies used in state-of-the-art deployment of language and speech technology in information access.

We would like to thank the editors, Steve Renals and Gregory Grefenstette, for their efforts to make this book happen, all the authors for their contributions to the 2000 Summer School and to this book, and the European Commission for their financial support.

Steven Krauer
