

Table of Contents

1. Introduction	1
2. Haziness about the economic model used for choosing policy	7
2.1. A Monetarist Lucas type transmission mechanism (model 1)	8
2.2. A Neo-Keynesian transmission mechanism with backward looking pricing (model 2)	9
2.3. A New-Keynesian transmission mechanism with forward looking pricing (model 3)	10
2.4. Comparison between the conceptions underlying the different models	11
2.5. Haziness about the meaning of potential or normal output	12
2.6. Implications for model transparency and for accountability	13
3. Are new CB transparent about their objectives?	14
3.1. The case for asymmetries in CB losses from the output gap	16
4. Is the credibility problem gone when the CB targets the normal level of output?	18
4.1. An asymmetry cum uncertainty inflation bias with a Lucas type transmission mechanism	19
4.2. Discussion	22
5. The effects of an asymmetric loss from the output gap in a Neo-Keynesian framework	24
5.1. Demonstration that expected inflation is positive	27
5.2. The average value of the output gap	28
5.3. Average inflation and output gaps under a strict inflation targeter as a benchmark	29
5.4. Summary thoughts on the long run non neutrality of the New-Keynesian framework and the implications for transparency	29
5.5. Implications of degree of flexibility in targeting inflation for real rates of interest	31
6. Concluding remarks	31
7. Appendix	35
7.1. Demonstration that uncertainty cum asymmetry of objectives produce a bias in the New-Keynesian framework	35
8. References	38
