Preface	ix
1 No more Mr Nice Guy	1
<b>Part 1 Foundations</b>	<b>21</b>
2 The calculus of hedonism	23
3 The price of everything and the value of nothing	54
4 Size does matter	85
5 To each according to his contribution	110
<b>Part 2 Complexities</b>	<b>127</b>
6 The holy war over capital	129
7 There is madness in their method	148
8 Let's do the Time Warp again	165
9 The sum of the parts	188
10 The price is not right	214
<b>Part 3 Alternatives</b>	<b>241</b>
11 Finance and economic breakdown	243
12 Don't shoot me, I'm only the piano	258
13 Nothing to lose but their minds	269
14 There are alternatives	300
References	314

# List of Figures

Figure 2.1	Total utils rise as more bananas are consumed, but at a decreasing rate	29
Figure 2.2	Total utils from the consumption of two commodities	31
Figure 2.3	Total 'Utils' represented as a 'utility hill'	32
Figure 2.4	The contours of the 'utility hill'	32
Figure 2.5	Indifference curves: the contours of the 'utility hill' shown in 2 dimensions	34
Figure 2.6	A rational consumer's indifference map	34
Figure 2.7	Indifference curves, the budget constraint, and consumption	35
Figure 2.8	Deriving the demand curve	37
Figure 2.9	Engels curves show how spending patterns change with increases in income	39
Figure 2.10	The economists' ambition: to derive social rationality from individual rationality	41
Figure 2.11	Intersecting 'social indifference curves' as price changes alter the distribution of income	43
Figure 2.12	Kinks in the 'social Engels curve' if consumers have different preferences	43
Figure 2.13	Discontinuities in a 'social utility curve' constructed by aggregating valid individual indifference curves: no change in demand for a change in prices	44

Figure 2.14	The only allowable utility curves if individual utilities are to be summed to yield social utility	45
Figure 2.15	Economic theory cannot rule out the possibility that a market demand curve may have a shape like this, rather than a smooth, downward-sloping curve	50
Figure 3.1	Product per additional worker falls as the number of workers hired rises	59
Figure 3.2	Swap the axes to graph labour input against quantity	61
Figure 3.3	Multiply labour input by the wage to convert Y-axis into monetary terms, and add the sales revenue	60
Figure 3.4	Maximum profit occurs where the gap between total cost and total revenue is at a maximum	62
Figure 3.5	Deriving marginal cost from total cost	63
Figure 3.6	The whole caboodle: average and marginal costs, and marginal revenue	63
Figure 3.7	The upward-sloping supply curve is derived by aggregating the marginal cost curves of numerous competitive firms	65
Figure 3.8	Economic theory doesn't work if Sraffa is right	66
Figure 3.9	Multiple demand curves with a broad definition of an industry	68
Figure 3.10	A farmer who behaved as economists advise would forgo the output shown in the shaded area	71
Figure 3.11	Costs determine price and demand determines quantity	72
Figure 3.12	A graphical representation of Sraffa's (1926) preferred model of the normal firm	75
Figure 3.13	Economics has no explanation of wage determination – or anything else – with constant returns	76
Figure 3.14	The economic theory of income distribution argues that the wage equals the marginal product of labour	78
Figure 3.15	Feasible supply and demand curves derived in accordance with economic theory	84
Figure 4.1	Price, total revenue and marginal revenue	89
Figure 4.2	Profit maximisation for a monopolist: marginal cost equals marginal revenue, while price exceeds marginal cost	91
Figure 4.3	Profit maximisation for a perfectly competitive firm: marginal cost equals marginal revenue, which also equals price	93
Figure 4.4	A supply curve can be derived for a competitive firm, but not for a monopoly	94
Figure 4.5	The economic argument in favour of competitive firms	95
Figure 4.6	The standard 'supply and demand' explanation for price determination is only valid in perfect competition	97

Figure 4.7	The higher output of a perfectly competitive industry relative to a monopoly means losses (for part of output) at the industry and individual firm level	100
Figure 4.8	Price and quantity are set by the intersection of the marginal cost and marginal revenue curves, and not by the intersection of demand with supply	102
Figure 4.9	Double the length, double the costs, but four times the output	104
Figure 4.10	The model of monopoly still works, but the model of perfect competition becomes indeterminate	106
Figure 5.1	The demand for labour curve is the marginal revenue product of labour	113
Figure 5.2	The individual's income-leisure trade-off determines how many hours of labour she supplies	115
Figure 5.3	An upward-sloping individual labour supply curve	116
Figure 5.4	Supply and demand determine the equilibrium wage in the labour market	116
Figure 5.5	Minimum wage laws cause unemployment	117
Figure 5.6	Demand management policies can't shift the supply of or demand for labour	118
Figure 5.7	Indifference curves that result in less work as the wage rises	119
Figure 5.8	Labour supply falls as the wage rises	120
Figure 5.9	An individual labour supply curve derived from extreme and midrange wage levels	121
Figure 5.10	An unstable labour market stabilised by minimum wage legislation	122
Figure 5.11	Interdependence of labour supply and demand via the income distributional effects of wage changes	125
Figure 6.1	The standard economic 'circular flow' diagram	131
Figure 6.2	The rate of profit equals the marginal product of capital	133
Figure 6.3	Supply and demand determine the rate of profit	134
Figure 6.4	The wage/profit frontier measured using the standard commodity	141
Figure 8.1	Comparative statics: increase the price and ignore the time	167
Figure 8.2	The time path of x-displacement in the Lorenz model	180
Figure 8.3	Sensitive dependence on initial conditions	181
Figure 8.4	Structure behind the chaos	182
Figure 8.5	Unstable equilibria	182
Figure 8.6	Cycles in employment and income shares	184

Figure 8.7	A closed loop in employment and wages share of output	185
Figure 8.8	Sustained aperiodic cycles in a macroeconomic model	186
Figure 8.9	The strange attractor behind the cycles shown in Figure 8	186
Figure 9.1	Hicks's model of Keynes	205
Figure 9.2	Derivation of the downward-sloping IS curve	206
Figure 9.3	Derivation of the upward-sloping LM curve	206
Figure 9.4	'Reconciling' Keynes with 'the Classics'	208
Figure 10.1	The economic theory of the interest rate	221
Figure 10.2	Capital market in equilibrium...	227
Figure 10.3	Investor indifference curves and the possibilities for investment	228
Figure 10.4	Borrowing and lending to maximise utility	229
Figure 10.5	The capital market risk–return line	231
Figure 10.6	The EMH view of how stock market investors behave	235
Figure 10.7	Keynes/Minsky/Haugen picture of investor behaviour	240
Figure 11.1	Lemming population as a constant subject to exogenous shocks	245
Figure 11.2	Lemming population as a variable with unstable dynamics	245
Figure 13.1	A graphical representation of Marx's dialectics	290

# List of tables

Table 2.1	'Utils' and change in utils from consuming bananas	29
Table 2.2	Utils arising from the consumption of two commodities	30
Table 3.1	Input and output data for a hypothetical firm	57
Table 3.2	Empirical support for firms setting price where $MC=MR$ (Eiteman and Guthrie 1952)	83
Table 4.1	Demand schedule for a hypothetical monopoly	88
Table 4.2	Costs for a hypothetical monopoly	90
Table 4.3	Sales and costs determine the level of output which maximises profit	90
Table 4.4	Cost and revenue for a 'perfectly competitive' industry identical in scale to hypothetical monopoly	96
Table 6.1	Sraffa's hypothetical subsistence economy	138
Table 6.2	Production with a surplus	139
Table 6.3	Linear relation between wage and profit in standard commodity units	140
Table 6.4	The impact of the rate of profit on the measurement of capital	143
Table 12.1	The solvability of mathematical models (adapted from Costanza 1993)	265
Table 13.1	Marx's unadjusted value creation table, with the rate of profit dependent upon the variable to constant ratio in each sector	282
Table 13.2	Marx's profit distribution table, with the rate of profit now uniform across sectors	282
Table 13.4	Steedman's physical table in Marx's value terms	283
Table 13.3	Steedman's hypothetical economy	283
Table 13.5	Steedman's prices table in Marx's terms	284

Table 13.6	Profit rate and prices calculated directly from output/wage data	285
Table 13.7	Marx's example where the use-value of machinery exceeds its depreciation	295
