

## CONTENTS

### Series Editor's Introduction v

- 1. Introduction: The Logic of Maximum Likelihood 1**
  - Background and Preliminaries 2
  - The Principle of Maximum Likelihood 7
  - Desirable Properties of Estimators 18
- 2. A General Modeling Framework Using Maximum Likelihood Methods 21**
  - The Normal PDF Model 24
  - Simple  $Z$  Tests and Confidence Intervals:
    - The Homoscedastic Normal PDF Model 25
  - Likelihood Ratio Tests: The Heteroscedastic Normal PDF Model 28
  - Wald Tests 34
  - A General Measure of Association for ML Models 35
- 3. An Introduction to Basic Estimation Techniques 39**
  - The Score Vector, Hessian Matrix, and Sampling Distribution of the MLE 39
  - The Iterative Process and Updating Methods 41
    - Obtaining Start Values 42
    - The Update Step and Checking for the Solution 42
- 4. Further Empirical Examples 46**
  - The Gamma PDF Model 46
    - Constant Coefficient of Variation Model 48
    - Sources of Variability in CV 50
  - The Multinomial PF Model 51
  - The Bivariate Normal PDF Model 56
- 5. Additional Likelihoods 62**
  - The Truncated Normal PDF Model 63
  - The Log-Normal PDF Model 66

**6. Conclusions 68**

**Appendix: Gauss Code for Some of the Models  
in the Monograph 68**

**Notes 83**

**References 84**

**About the Author 87**
