On the Effect of the Internal Friction of Fluids on the Motion of Pendulums	1
PART I. Analytical Investigation.	
SECTION I. Adaptation of the General Equations to the case of the Fluid surrounding a Body which oscillates as a Pendulum. General Laws which follow from the form of the Equations. Solution of the Equations in the case of an Oscillating Plane	11
SECTION II. Solution of the Equations in the case of a Sphere oscillating in a mass of Fluid either unlimited, or confined by a Spherical Envelope concentric with the Sphere in its position of Equilibrium	22
SECTION III. Solution of the Equations in the case of an Infinite Cylinder oscillating in an unlimited mass of Fluid, in a direction perpendicular to its axis	38
SECTION IV. Determination of the Motion of a Fluid about a Sphere which moves uniformly with a small velocity. Justification of the Application of the Solutions obtained in Sections II. and III. to cases in which the extent of Oscillation is not small in comparison with the radius of the Sphere or Cylinder. Discussion of a difficulty which presents itself with reference to the uniform motion of a Cylinder in a Fluid	55
SECTION V. On the effect of Internal Friction in causing the Motion of a Fluid to subside. Application to the case of Oscillatory Waves	67
PART II. Comparison of Theory and Experiment.	
SECTION I. Discussion of the Experiments of Baily, Bessel, Coulomb, and Dubuat	76
SECTION II. Suggestions with reference to future Experiments	123
An Examination of the possible effect of the Radiation of Heat on the Propagation of Sound	142
Passages from the original not included in the reprint of 1901	154A

	PAGE
On the Colours of Thick Plates	155
SECTION I. Rings thrown on a Screen by a Concave Mirror consisting of a lens dimmed at the first surface, and quicksilvered at the back. Condition of distinctness when the Rings are thrown on a Screen, or of fixity when they are viewed in Air. Investigation of the phenomena observed when the Luminous Point is moved in a direction perpendicular to the Axis of the Mirror	160
SECTION II. Bands formed by a Plane Mirror, and viewed directly by the Eye	170
SECTION III. Rings formed by a Curved Mirror, and viewed directly by the Eye, when the Luminous Point and its Image are not in the same plane perpendicular to the axis	178
SECTION IV. Straight bands formed by a Plane Mirror at a considerable angle of incidence, and viewed by the Eye, either directly, or through a Telescope	184
SECTION V. On the Nature of the Deflection of the two Interfering Streams from the course of the regularly Refracted Light	186
SECTION VI. Investigation of the Angles of Diffraction	191
On a new Elliptic Analyser	197
On the Conduction of Heat in Crystals	203
On the Total Intensity of Interfering Light	228
On the Composition and Resolution of Streams of Polarized Light from different Sources	233
Abstract of a paper "On the Change of Refrangibility of Light"	259
On the Change of Refrangibility of Light	267
Notes added during printing of the original paper	400
Special index for that paper	408
Addition, introduced in the reprint	410
Index	415
Plate	<i>to face p.</i> 285

ERRATA IN VOL. II.

p. 334, equation (10). Insert "=" before " $\frac{1}{2}\sqrt{-1}$ "

p. 355, equation (66), last term. For ".245835" (log.= $\bar{1}$.390644) read ".245270" (log.= $\bar{1}$.389644)
