Volume I ALGEBRA

INTRODUCTION	xv
1. SETS	1
I. Stewart, <i>University of Warwick, U.K.</i>	
1.1. Sets	1
1.2. Set algebra	3
1.2.1. Unions and intersections	3
1.2.2. Venn diagrams	5
1.2.3. Subsets	7
1.2.4. Complements	9
1.2.5. Membership tables	10
1.2.6. Ordered pairs	11
1.2.7. Sets of sets	13
1.3. Relations	15
1.3.1. The definition of a relation	15
1.3.2. Order relations	16
1.3.3. Equivalence relations	16
1.3.4. The integers modulo n	18
1.4. Functions	20
1.4.1. The definition of a function	20
1.4.2. Fundamental properties of functions	24
1.5. Binary operations	27
1.6. Cardinal numbers	29
2. NUMBERS	31
T.H. Jackson, <i>University of York, U.K.</i>	
2.1. The natural numbers	31
2.2. The integers	35
2.2.1. Definition and properties of the integers	35
2.2.2. Further properties of integers	38
2.3. Rings	40
2.4. Rational numbers and fields	42
2.4.1. Definition and properties of the rational numbers	42
2.4.2. Fields	44
2.5. Decimal expansions	47
2.6. Real numbers	52
2.6.1. Definition of the real numbers	52
2.6.2. Properties of real numbers	54
2.6.3. Sets of real numbers	56

2.6.4. Roots of real numbers	59
2.7. <i>Complex numbers</i>	60
2.7.1. The field of complex numbers	60
2.7.2. Geometrical representation of complex numbers	64
2.7.3. Polar coordinates of complex numbers	70
2.7.4. Roots of complex numbers	73
2.8. <i>Quaternions</i>	75
3. ARITHMETIC	79
D.O. Tall, University of Warwick, U.K.	
3.1. <i>Powers</i>	79
3.2. <i>Inverses</i>	81
3.3. <i>Roots</i>	82
3.4. <i>Definitions of a^b for real $a > 0$ and any real b</i>	85
3.5. <i>The function $f(x) = a^x$ for $a > 0$</i>	86
3.6. <i>Logarithms</i>	87
3.7. <i>Permutations</i>	90
3.8. <i>Combinations</i>	92
3.9. <i>Partitions and more general computations</i>	93
3.10. <i>Generating functions and relations between binomial coefficients</i>	95
3.11. <i>Use of generating functions in enumeration problems</i>	97
4. NUMBER THEORY	101
T.H. Jackson, University of York, U.K.	
4.1. <i>Divisibility</i>	101
4.1.1. Division in rings	101
4.1.2. Euclidean domains	102
4.1.3. Common divisors	104
4.2. <i>Primes and prime decomposition</i>	107
4.3. <i>Congruences</i>	110
4.3.1. The algebra of congruences	110
4.3.2. Finite rings	113
4.3.3. Finite fields	115
5. LINEAR ALGEBRA	117
W. Ledermann, University of Sussex, U.K.	
5.1. <i>Displacements</i>	117
5.2. <i>Vector spaces</i>	119
5.3. <i>Linear dependence</i>	121
5.4. <i>Basis and dimension</i>	125
5.5. <i>Subspaces</i>	127
5.6. <i>Rank</i>	130
5.7. <i>Linear equations—preliminaries</i>	133
5.8. <i>Linear equations—the regular case</i>	134
5.9. <i>Linear equations—homogeneous systems</i>	136
5.10. <i>Linear equations—non-homogeneous systems</i>	137
5.11. <i>Linear maps</i>	141
5.12. <i>Change of basis</i>	146
5.13. <i>Linear transformations</i>	150

6. MATRICES AND DETERMINANTS	153
W. Ledermann, University of Sussex, U.K.	
6.1. Motivation	153
6.2. Matrix algebra	155
6.3. Formal laws	160
6.4. The inverse matrix	160
6.5. Transposition	167
6.6. Partitioned matrices	168
6.7. Matrices of special types	170
6.8. Motivation for determinants	177
6.9. Formal definition of a determinant	180
6.10. General laws for determinants	182
6.11. Cofactors	184
6.12. Cramer's Rule	187
6.13. Minors	189
6.14. Some special determinants	191
6.15. The Kronecker product	193
7. EIGENVALUES	195
W. Ledermann, University of Sussex, U.K.	
7.1. Geometrical motivation	195
7.2. Simple algebraic properties	196
7.3. The characteristic polynomial	198
7.4. Similar matrices	203
7.5. Matrix equations	206
7.6. The Jordan canonical form	208
7.7. Unitary (orthogonal) equivalence	215
7.8. The Principal Axes theorem	216
7.9. Extremal properties	222
7.10. Spectral decomposition	225
7.11. Non-negative matrices	227
7.12. Simultaneous diagonalization	230
7.13. Inequalities for eigenvalues	232
8. GROUPS	237
C. Alexander and W. Ledermann, University of Sussex, U.K.	
Introduction	237
8.1. Permutations	238
8.1.1. The algebra of permutations	242
8.1.2. Properties of permutations	243
8.1.3. Even and odd permutations	245
8.2. Groups	245
8.2.1. The group concept	249
8.2.2. Group tables	250
8.2.3. Generators and relations	255
8.2.4. Subgroups and cosets	258
8.2.5. Properties of group elements	259
8.2.6. Normal subgroups and factor groups	262
8.2.7. Homomorphisms between groups	265
8.2.8. Permutation groups and Cayley's theorem	265

8.2.9. Direct products	266
8.3. Representations of groups	268
8.3.1. Introduction	268
8.3.2. Matrix representations of groups	269
8.3.3. Reducibility of matrix representations	273
8.3.4. Linear representations of finite Abelian groups	276
8.3.5. Group characters	278
8.3.6. Orthogonality properties of group characters	281
8.3.7. Matrix representations of permutation groups	283
8.4. Other mathematical structures	286
9. BILINEAR AND QUADRATIC FORMS	287
P. Hilton, State University of New York, Binghamton, USA.	
9.1. Classification of quadratic forms under congruence	287
9.2. Definiteness of quadratic forms	293
9.3. Hermitian forms	296
10. METRIC VECTOR SPACES	299
P. Hilton, State University of New York, Binghamton, USA.	
10.1. Inner products and metrics	299
10.2. Inner product spaces	302
10.3. Complex inner product spaces	306
11. LINEAR PROGRAMMING	309
K. Trustrum, University of Sussex, U.K.	
11.1. Introduction	309
11.1.1. The diet problem	309
11.1.2. Nomenclature	311
11.2. Primal and dual programmes	311
11.2.1. Dual of the diet problem	311
11.2.2. Matrix formulation of primal and dual programmes	312
11.2.3. Relations between primal and dual programmes	313
11.2.4. Results of duality theory	314
11.2.5. Alternative form for primal and dual programmes	315
11.3. The transportation problem	316
11.3.1. Formulation and solution of the transportation problem	316
11.3.2. The assignment problem	321
11.3.3. The transshipment problem	321
11.4. The simplex method	324
11.4.1. Outline of simplex method	324
11.4.2. Determination of basic feasible solutions	324
11.4.3. Choice of pivot	326
11.4.4. Operation of pivot rule	327
11.4.5. Solution of dual programme	329
11.4.6. Inverse matrix (revised simplex) method	330
11.4.7. Dual simplex method	331
11.4.8. Degeneracy	331
11.4.9. Sensitivity analysis	331
11.4.10. Parametric linear programming	332
11.4.11. Decomposition method	333
11.5. Applications	333
11.5.1. A production scheduling problem	333
11.5.2. A cutting problem	334
11.5.3. Revenue maximization	335

12. INTEGER PROGRAMMING	339
H. P. Williams, University of Edinburgh, U.K.	
<i>Introduction</i>	339
12.1. <i>The applicability of integer programming</i>	341
12.1.1. Problems involving discrete activities	341
12.1.2. Problems involving discrete resources	342
12.1.3. Fixed change problems	342
12.1.4. Problems with logical conditions	342
12.1.5. Non-linear problems	343
12.1.6. Combinatorial problems	343
12.2. <i>Building integer programming models</i>	344
12.2.1. The uses of integer variables	345
12.2.2. The uses of integer constraints	345
12.2.3. The relationship between integer programming models and linear programming models	356
12.3. <i>Solving integer programming models</i>	359
12.3.1. General methods of solving integer programming models	361
(a) The Branch and Bound algorithm	361
(b) The Cutting Planes algorithm	365
12.3.2. Specialist methods of solving integer programming models	371
(a) Implicit enumeration	371
(b) The pseudo-Boolean algorithm	374
12.3.3. Other approaches to solving integer programming models	377
(a) Partitioning a MIP model (Benders' decomposition)	377
(b) Dynamic programming	377
(c) Group theory	379
(d) Lagrangean relaxation	380
(e) Approximate methods	383
12.4. <i>Areas for future development</i>	385
12.5. <i>References and further reading</i>	386
12.6. <i>Bibliography</i>	388
13. THE THEORY OF GAMES	391
S. Vajda, University of Sussex, U.K.	
13.1. <i>Introduction</i>	391
13.1.1. Background	391
13.1.2. Concepts and definitions	392
13.2. <i>Matrix games</i>	393
13.2.1. Pure strategies	393
13.2.2. Mixed strategies	396
13.2.3. Solutions and equilibrium points	397
13.2.4. Methods for solving small rectangular games	399
13.2.5. Dominance	401
13.2.6. Games against nature	403
13.2.7. Fixed points	405
13.3. <i>More-person games</i>	407
13.3.1. Non-cooperative games	407
13.3.2. Cooperative games	408
13.3.3. von Neumann-Morgenstern solution	409
13.3.4. Another concept of solution: the Shapley value	410
13.4. <i>Non-zero-sum games</i>	411
13.5. <i>Extensive games</i>	413
13.6. <i>Infinite games</i>	416

13.6.1. Pure strategies	417
13.6.2. Duels	419
13.6.3. Statistical decision procedures	420
14. POLYNOMIALS AND RATIONAL FUNCTIONS	423
W. Ledermann, University of Sussex, U.K. and S. Wylie., Cambridge U.K.	
14.1. Polynomials in a single variable	423
14.2. Algebra of polynomials	425
14.3. The division algorithm	425
14.4. Factorization	430
14.5. Roots of polynomials	431
14.6. Repeated factors	434
14.7. Locating the real zeros	435
14.8. Finding the number of real roots of a polynomial	436
14.9. Real rational functions	439
14.10. Partial fractions	440
14.11. Applications of partial fractions	444
14.12. Linear recursive sequences	446
14.13. Solution of recurrence relations	447
14.14. Systems of recurrence relations	454
14.15. Polynomials in several indeterminates	456
14.16. Symmetric polynomials	458
15. FINANCIAL MATHEMATICS	463
S. Vajda, University of Sussex, U.K.	
15.1. Investments, annuities and loans	463
15.1.1. Interest	463
15.1.2. Annuities	464
15.1.3. Repayment of loans	465
15.1.4. Intrinsic rate of interest	467
15.2. Actuarial mathematics	468
15.2.1. Life contingencies	468
15.2.2. Policy values	470
15.2.3. Other assurance types	473
15.2.4. Continuous mortality	473
16. BOOLEAN ALGEBRA	477
D. MacHale, University College, Cork, Ireland.	
16.1. Laws of a Boolean algebra	477
16.2. The inclusion relation	480
16.3. Truth tables	482
16.4. Switching circuits	484
16.5. Mathematical logic	488
17. UNITS OF MEASUREMENT	493
P. J. Unsworth, University of Sussex, U.K.	
17.1. Introduction	493
17.1.1. Physical quantities, units and dimensions	493
17.1.2. Systems of units	494
17.2. SI units— <i>Le Système International des Unités</i>	495
17.2.1. The SI base units	496
17.2.2. SI supplementary units	497

17.2.3. SI derived units	498
17.2.4. SI prefixes	498
17.2.5. Rules for printing of SI symbols	499
17.2.6. Units outside the SI system	500
17.3. Other systems of units	501
17.4. Checking by dimensions	501
17.5. Conversion of units	502
17.6. Formulation of equations with inconsistent units	502
17.7. Table of conversion factors between SI and non-SI units	503
17.8. Dimensional analysis	503
17.8.1. Method of indices	510
17.8.2. Method of dimensionless groups	511
INDEX	515

Volume II PROBABILITY

E. Lloyd, University of Lancaster, U.K.

INTRODUCTION	xvii
1. INTRODUCTION: PROBABILITY AND STATISTICS	1
2. BASIC CONCEPTS OF PROBABILITY	3
2.1. Randomness	3
2.2. Frequency tables	5
2.3. Probability: intuitive ideas	6
3. THE CALCULUS OF PROBABILITY	9
3.1. Sample space. Events and sets	9
3.2. Axioms of probability for discrete sample spaces	10
3.3. Randomization. Fundamental sampling theorem	11
3.4. Relationships between events	14
3.4.1. Negation	14
3.4.2. Conjunction	16
3.4.3. $P(AB)$ in terms of $P(A)$ and $P(B)$: Disjoint events	17
3.4.4. Disjunction	19
3.4.5. Note on notation	21
3.4.6. Conjunctions and disjunctions involving more than two events	22
3.4.7. Implication	24
3.5. Statistical independence	25
3.6. Some applications of the concept of independence	28
3.6.1. Reduction in dimensionality of sample space	28
3.6.2. Axiom on independence-conferring property of randomization	29
3.6.3. Sampling with replacement from a finite population	29
3.7. Bernoulli trials: sampling with replacement from a finite population containing only two kinds of articles	30
3.8. Bernoulli trials in other contexts including (as an approximation) sampling without replacement. The Bernoulli process	32
3.9. Non-independent events and conditional probability	33
3.9.1. Conditional probability	33
3.9.2. Conditional probability and a factorization rule for $P(A \text{ and } B)$	36
3.9.3. Conditional probability and independence	37

3.9.4. Conditional probabilities are probabilities	38
3.9.5. Manipulative properties of conditional probabilities	38
3.9.6. Conditional probability statements involving more than two events	39
4. RANDOM VARIABLES AND THEIR REALIZATIONS; PROBABILITY DISTRIBUTIONS	41
4.1. <i>Random variables</i>	41
4.2. <i>Random variables as functions</i>	42
4.3. <i>The probability distribution of integer-valued random variables</i>	43
4.3.1. Distribution specified by p.d.f.	43
4.3.2. Distribution specified by c.d.f.	45
4.4. <i>Multivariate random variables: independent random variables</i>	47
4.5. <i>The calculus of random variables: addition</i>	49
4.5.1. Introduction	49
4.5.2. Addition of random variables	52
4.6. <i>Constants regarded as random variables</i>	55
4.7. <i>Transformations of random variables</i>	56
5. A FIRST CATALOGUE OF DISCRETE PROBABILITY DISTRIBUTIONS (INTEGER-VALUED VARIABLES)	59
5.1. <i>The discrete uniform distribution</i>	59
5.2. <i>Distributions arising in connection with the Bernoulli sequence</i>	62
5.2.1. Bernoulli trial variables: trials with success-parameter p (' p -trials')	62
5.2.2. The binomial distribution with n trials and success parameter p (the binomial (n, p) distribution)	63
5.2.3. The geometric distribution	67
(i) first version	67
(ii) second version of the geometric distribution	69
5.2.4. The negative binomial distribution (the Pascal distribution)	70
5.3. <i>The hypergeometric distribution</i>	71
5.4. <i>The Poisson distribution</i>	74
5.5. <i>The Poisson distribution as approximation to the binomial and to the hypergeometric distribution</i>	76
5.6. <i>Simulation: generating realizations of a discrete random variable</i>	77
6. INDEPENDENT AND NON-INDEPENDENT RANDOM VARIABLES AND THEIR JOINT DISTRIBUTIONS, BIVARIATE AND MULTIVARIATE; MARGINAL AND CONDITIONAL DISTRIBUTIONS	83
6.1. <i>Bivariate distributions</i>	83
6.1.1. Bivariate random variables and their joint p.d.f.	83
6.1.2. Bivariate distributions and their joint c.d.f.	85
6.2. <i>Bivariate frequency tables</i>	87
6.3. <i>Marginal distributions</i>	88
6.3.1. Introduction	88
6.3.2. Marginal distributions in the case of independence	89
6.4. <i>An important multivariate distribution: the multinomial and a special case: the trinomial</i>	90
6.4.1. The trinomial distribution	90
6.4.2. Multinomial distributions and their marginals	91
6.5. <i>Conditional probabilities and conditional distributions</i>	94
6.6. <i>Bivariate and multivariate probabilities expressed in terms of conditional probabilities, and the special case of independence</i>	99

6.6.1. Introduction	99
6.6.2. The special case of independence. Distribution of a sample	101
6.7. <i>Truncated distributions</i>	102
6.8. The 'residual waiting time' property of the geometric distribution	105
6.9. The interval between successive failures is a Bernoulli process	106
7. THE ADDITION OF RANDOM VARIABLES: CONVOLUTION	109
7.1. <i>Introduction</i>	109
7.2. <i>Non-negative variables</i>	111
7.3. <i>Variables bounded above and below</i>	112
7.4. <i>Examples of the convolution operation</i>	112
7.4.1. The sum of independent p -binomials is p -binomial	112
7.4.2. The sum of geometrically distributed variables	114
8. EXPECTATION (EXPECTED VALUE)	115
8.1. <i>Motivation and definition: examples</i>	115
8.2. <i>Expectation of a sum</i>	117
8.3. <i>Expectation of a constant</i>	119
8.4. <i>Expectation of a linear function of random variables</i>	119
8.5. <i>Expectation of a non-linear function of a random variables</i>	120
8.6. <i>Expectation of a product of independent variables</i>	123
8.7. <i>Variables that do not have a finite expectation</i>	124
8.8. <i>A minimizing property of $E(X)$</i>	124
8.9. <i>Conditional expectation</i>	125
9. VARIANCE, COVARIANCE, AND HIGHER MOMENTS	129
9.1. <i>Variance: motivation, and definition of sample variance</i>	129
9.2. <i>Standard deviation and variance of a random variable ('population values')</i>	131
9.2.1. Definitions and examples	131
9.2.2. Effect of linear transformation	134
9.2.3. Variance of a sum of independent variables	134
9.2.4. Variance of scaled sum of independent variables	134
9.2.5. Variance of a linear function of independent variables	135
9.2.6. Coefficient of variation	135
9.3. <i>Random variables that do not have a finite variance</i>	136
9.4. <i>Scaling, standardization and skewness</i>	136
9.5. <i>Chebyshev's inequality. Markov's inequality</i>	137
9.6. <i>Covariance. Variance of a linear function of random variables.</i>	
<i>Uncorrelated variables</i>	139
9.6.1. Definition of covariance	139
9.6.2. Properties of the covariance operator	142
9.6.3. Uncorrelated variables	144
9.6.4. Covariance of one linear function with another: matrix form	146
9.6.5. Variance of a linear function	146
9.7. <i>The variance-covariance inequality</i>	148
9.8. <i>The correlation coefficient</i>	148
9.8.1. Definition and basic properties	148
9.8.2. The correlation coefficient and linear transformations	149
9.8.3. The correlation coefficient as a measure of statistical association	150
9.9. <i>Approximations for the expectation, variance and covariance of nonlinear functions</i>	152
9.9.1. Introduction	152
9.9.2. Approximations for $E\{h(X)\}$	152

9.9.3. Approximations for var $\{h(X)\}$	154
9.9.4. Approximations for cov $\{g(X_1), h(X_2)\}$	154
9.10. <i>Shape: skewness and kurtosis</i>	155
9.10.1. Geometrical motivation	155
9.10.2. Coefficient of skewness of linear transformations and sums of random variables	156
9.10.3. Coefficient of skewness of a sum of independent and identically distributed variables	157
9.10.4. Kurtosis	157
9.11. <i>Moments</i>	157
9.12. <i>Conditional variance and conditional moments</i>	159
10. CONTINUOUS DISTRIBUTIONS	161
10.1. <i>Introduction</i>	161
10.1.1. Basic properties of the p.d.f. and the c.d.f.	161
10.1.2. An intuitive interpretation of the graph of a p.d.f.	164
10.1.3. The mode of a continuous p.d.f.	165
10.2. <i>Some examples of continuous random variables</i>	166
10.2.1. The continuous uniform distribution	166
10.2.2. n uniformly distributed particles	168
10.2.3. The exponential distribution	170
10.3. <i>The cumulative distribution function and the probability density function of a continuous random variable</i>	171
10.3.1. The cumulative distribution function	171
10.3.2. The probability density function	173
10.3.3. Fractiles and percentiles	176
10.4. <i>Measures of location and scale</i>	177
10.4.1. Expected value and variance of a continuous random variable	177
10.4.2. Other measures of location and scale	180
10.5. <i>Joint distributions: independence</i>	181
10.6. <i>Expected value of a sum</i>	183
10.7. <i>Transformations</i>	185
10.8. <i>Convolutions</i>	188
11. A CATALOGUE OF CONTINUOUS PROBABILITY DISTRIBUTIONS	191
11.1. <i>The continuous uniform distribution</i>	191
11.1.1. Standard and other forms	191
11.1.2. Convolutions of uniformly distributed variables	193
11.2. <i>The (negative) exponential distribution</i>	196
11.2.1. Standard and other forms	196
11.2.2. Convolutions and special properties	198
11.3. <i>The gamma family</i>	199
11.3.1. Standard and scaled forms of the p.d.f. of the gamma distribution	199
11.3.2. Relation between gamma and exponential distributions; convolutions. Erlangian distributions	201
11.3.3. Occurrence and applications	202
11.4. <i>The Normal (Gaussian) distribution</i>	203
11.4.1. Standard form	203
11.4.2. Occurrence and applications: Introduction to the central limit theorem	204
11.4.3. The Normal family	206
11.4.4. The value of a certain definite integral	208
11.4.5. Convolutions of Normal distribution	208
11.4.6. Numerical values of Normal probabilities. Use of tables	209
11.4.7. The Normal distribution as an approximation to the binomial	210

11.4.8. Normal probability graph paper ('arithmetic probability paper')	212
11.4.9. The Normal distribution and errors of measurement	214
11.4.10. The Normal distribution and errors of computation	214
11.4.11. The Chi-squared distribution	216
11.5. The log-Normal distribution	217
11.6. The Beta distribution	219
11.6.1. Standard form	219
11.6.2. Linearly transformed Beta distribution	220
11.6.3. Relation of Beta distribution with other distributions	221
11.7. The Cauchy distribution	221
11.8. The Pareto distribution	222
11.9. The Weibull distribution	224
11.10. The Logistic distribution	225
11.11. The Powered Gamma distribution (Kritskii-Menkel)	226
11.12. The Pearson System	228
11.13. Simulation: generating realizations of continuous random variables	229
12. GENERATING FUNCTIONS	231
12.0. Introduction	231
12.1. The probability generating function (p.g.f.)	231
12.1.1. Definition of the p.g.f.	231
12.1.2. The p.g.f. as expectation	232
12.1.3. Convolutions	233
12.1.4. Tail probabilities	234
12.1.5. Expectation obtained from the p.g.f.	235
12.1.6. Variance obtained from the p.g.f.	235
12.1.7. Extended definition of the p.g.f.: variables taking positive and negative values. The p.g.f. of $R - T$	236
12.1.8. Probability generating function of a discrete random variable whose values are not necessarily integers	238
12.1.9. The p.g.f. of a multivariate distribution	240
12.2. The moment generating function (m.g.f.)	242
12.2.1. Definition	242
12.2.2. Major properties	243
12.2.3. Bivariate and multivariate m.g.f.'s	244
12.3. The Laplace Transform (L.T.)	246
12.4. The characteristic function	246
12.4.1. Introduction and definition	246
12.4.2. Linear transformations	248
12.4.3. Principal properties	248
12.4.4. Bivariate and multivariate c.f.'s	249
12.5. The second characteristic function (cumulant generating function)	250
12.5.1. Definition	250
12.5.2. Another version of the c.g.f.	250
12.5.3. Relation between cumulants and moments	251
12.5.4. Effect of shift of origin	252
12.5.5. Cumulants of a sum of random variables	253
12.6. The factorial moment generating function (f.m.g.f.)	253
13. MULTIVARIATE CONTINUOUS DISTRIBUTIONS	255
13.1. Joint, marginal and conditional distributions; independence	255
13.1.1. Introduction: joint distributions	255
13.1.2. Marginal distributions	257
13.1.3. The moments of a multivariate distribution	259

13.1.4. Conditional distributions	261
13.1.5. Regression	262
13.1.6. Independence: the distribution of a sample	263
13.1.7. Multivariate moment generating functions	264
13.2. <i>Multivariate transformations</i>	265
13.2.1. Introduction	265
13.2.2. Invertible transformations	265
13.3. <i>Linear operations on jointly distributed random variables</i>	267
13.3.1. Vector variables, expectation vector, dispersion matrix	267
13.3.2. Linear transforms	269
13.3.3. More on variances and covariances	270
(i) The cross-covariance matrix	270
(ii) Dispersion matrix of a sum	270
13.3.4. The bivariate Normal distribution	270
13.4. <i>The multivariate Normal (MVN) distribution</i>	272
13.4.1. The MVN density function	272
13.4.2. The MVN distribution and independence	274
13.4.3. Moment generating function of the MVN distribution	275
13.4.4. The marginal distribution of the MVN	276
(i) Normal marginals do not imply a Multivariate Normal distribution	279
(ii) Marginal distribution of the MVN derived in terms of the moment generating function	279
13.4.5. The conditional distributions of the MVN	280
13.4.6. Summary of properties of the bivariate and trivariate Normal distribution	281
(i) Bivariate Normal	281
(ii) Trivariate Normal	282
(iii) Partial Correlation coefficient	284
13.4.7. The joint distribution of a set of linear functions of MVN variables	284
Independence and Orthogonal transformations in the MVN	285
13.4.8. The distribution of a certain quadratic form	286
13.5. <i>An example of a non-Normal multivariate distribution. The Dirichlet distribution: a multivariate beta</i>	286
13.6. <i>Linear regression ('multiple regression') and the multiple correlation coefficient</i>	287
14. <i>MISCELLANEOUS TOPICS ON DISTRIBUTIONS</i>	289
14.1. <i>Distributions that are part continuous, part discrete</i>	289
14.2. <i>Mixtures of distributions</i>	290
14.3. <i>Compound distributions: the sum of a random number of random variables</i>	292
14.3.1. Distribution of S_N	292
14.3.2. Mean and variance of S_N	293
14.3.3. Use of the Probability Generating Function for compound distributions	294
14.3.4. Moment generating function of S_N	295
15. <i>ORDER STATISTICS</i>	297
15.1. <i>Introduction</i>	297
15.2. <i>The distribution of individual order statistics when the underlying distribution is continuous</i>	299
(i) Largest value	299
(ii) Smallest value	300
(iii) A general value	301
(iv) Order statistics of the exponential and the logistic distributions	303
15.3. <i>The order statistics of discrete variables</i>	303

15.4.	<i>The joint distribution of several order statistics in samples from a continuous distribution</i>	306
15.5.	<i>Median, range and extreme values for continuous distributions</i>	307
15.6.	<i>'Extreme-value' distributions</i>	310
16.	MISCELLANEOUS TOPICS INVOLVING CONDITIONAL PROBABILITY	313
16.1.	<i>The conditional variable $X y$</i>	313
16.2.	<i>Theorem of Total Probability</i>	314
16.3.	<i>The conditional expectation theorem</i>	316
16.4.	<i>Bayes' Theorem</i>	319
16.4.1.	<i>Introduction: Bayes' Theorem with binomial sampling</i>	319
16.4.2.	<i>Bayes' Theorem with general sampling from a population selected from a finite or countable set</i>	321
16.4.3.	<i>Bayes' Theorem for a continuous parameter</i>	322
17.	LAWS OF LARGE NUMBERS. STABLE DISTRIBUTIONS	325
17.1.	<i>The (weak) law of large numbers</i>	325
17.2.	<i>Strong law of large numbers</i>	326
17.3.	<i>Central Limit Theorem</i>	327
17.4.	<i>Stable distributions</i>	328
18.	STOCHASTIC PROCESSES: INTRODUCTION AND EXAMPLES	331
18.0.	<i>Introduction: The state space and parameter space</i>	331
18.0.1.	<i>Univariate random variables</i>	331
18.0.2.	<i>Multivariate random variables</i>	331
18.0.3.	<i>Discrete-state or continuous-state stochastic processes with discrete parameter</i>	332
18.0.4.	<i>Continuous-parameter stochastic processes</i>	334
18.0.5.	<i>Other classifications of stochastic processes</i>	334
18.0.6.	<i>Dimensionality</i>	335
18.0.7.	<i>Sequence of sums of random variables</i>	335
18.1.	<i>The branching process</i>	336
18.1.1.	<i>General description</i>	336
18.1.2.	<i>Mean size of the nth generation</i>	338
18.1.3.	<i>Probabilities of ultimate extinction and of indefinite survival</i>	338
18.1.4.	<i>Population size after a large number of generations</i>	340
18.1.5.	<i>Effect of starting from more than a single initial particle</i>	340
18.1.6.	<i>Applications to survival of family names</i>	340
18.2.	<i>The Gambler's Ruin</i>	341
18.2.1.	<i>Introduction</i>	341
18.2.2.	<i>The probability of ruin</i>	342
18.2.3.	<i>Expected duration of play</i>	343
18.2.4.	<i>Distribution of duration of play</i>	344
18.3.	<i>The Random Walk</i>	346
18.3.1.	<i>Introduction: the state space and the parameter space</i>	346
18.3.2.	<i>Simple random walk. First passages. Absorbing barriers</i>	346
(i)	<i>Unrestricted simple random walk</i>	346
(ii)	<i>First passages</i>	349
(iii)	<i>First passages by the method of unit descents</i>	350
(iv)	<i>An improper random variable</i>	352
(v)	<i>First passage time by the method of images: (geometric version)</i>	352
(vi)	<i>The method of images (analytic version)</i>	354
(vii)	<i>First returns in an unrestricted random walk</i>	355
(viii)	<i>Time to absorption, by the method of images</i>	357
(ix)	<i>First passages when there are two absorbing barriers</i>	358

18.4. More general one-dimensional random walks. Wald's identity	362
18.5. Diffusion	370
19. PROCESSES IN DISCRETE TIME: MARKOV CHAINS	373
19.1. Generalities on stochastic processes	373
19.2. General dependence, independence and Markovian dependence	374
19.3. Discrete-state Markov Chains	375
19.4. The s -step transition probability	382
19.5. The distribution of X_t	385
19.6. The equilibrium distribution, the stationary distribution and ergodic chains	387
19.7. Classification of states and chains	388
19.7.1. Communicating states	388
19.7.2. Irreducible chains	389
19.7.3. Periodic and aperiodic chains	389
19.7.4. Irreducible chains and equilibrium distributions	390
19.7.5. Further properties of Markov Chains. Closed sets and absorbing states: transient states	392
19.8. The correlation function of a Markov Chain	393
19.9. Markov Chains of the second (or higher) order	397
19.10. Continuous-state Markov Chains	400
20. CONTINUOUS-TIME PROCESSES	403
20.1. The Poisson process	403
20.1.1. General definition: the one-dimensional process	403
20.1.2. Waiting times from a fixed origin	406
20.1.3. Interval between consecutive events	408
20.1.4. Superposition of independent Poisson processes	408
20.1.5. Clustering	409
20.1.6. Non-homogeneous Poisson processes	409
20.1.7. The homogeneous Poisson process in two or more dimensions	410
20.1.8. Nearest neighbours	410
20.1.9. Spatio-temporal Poisson fields	411
20.1.10. Projections of multi-dimensional Poisson processes	411
20.2. Birth processes	411
20.3. The two-state process	413
20.4. The Birth-and-Death process	414
20.4.1. General description	414
20.4.2. Statistical equilibrium	415
20.4.3. Special case: 'Linear growth'	416
20.5. The simple queue	417
20.6. Markov chains with continuous time parameters	418
21. RENEWALS	421
21.1. Integer-valued random variables. Introduction, Definition, Examples	421
21.2. Fundamental theorems on recurrence-time distributions	423
21.3. Number of occurrences	427
21.4. The Markov chain as a renewal process	428
21.5. Modified renewal processes	431
21.6. Renewal theory in continuous time	431

22. COMPLEMENTS ON STOCHASTIC PROCESSES: SECOND ORDER PROCESSES	433
22.1. Definitions	433
22.2. The covariance function	434
22.2.1. Definitions	434
22.2.2. Properties of the auto-covariance function	435
22.3. Spectral density	436
22.4. Introduction to stochastic analysis	436
22.4.1. Convergence	436
22.4.2. Continuity	437
22.4.3. Differentiability	438
BIBLIOGRAPHY	439
INDEX	443

Volume III NUMERICAL METHODS

INTRODUCTION	xiii
1. INTRODUCTION TO NUMERICAL METHODS	1
R.F. Churchhouse, University College, Cardiff, U.K.	
1.1. History	1
1.2. Numerical methods	2
1.3. Errors	3
1.4. Finite differences	7
1.5. Divided differences	13
1.6. Taylor's theorem	16
1.7. Ill-conditioned problems	17
2. COMPUTATION AND INTERPOLATION OF FUNCTIONS	19
R.F. Churchhouse, University College, Cardiff, U.K.	
2.1. Introduction	19
2.2. Methods of computation	19
2.2.1. Direct methods of computation	22
2.3. Interpolation	27
2.3.1. Interpolation based on equidistant points	33
2.3.2. Subtabulation	36
2.3.3. Inverse interpolation	39
2.3.4. Lagrange's Interpolation Formula	44
2.3.5. Other methods of interpolation	44
2.4. Extrapolation	45
2.4.1. Special forms of extrapolation	46
3. THE SOLUTION OF SYSTEMS OF LINEAR EQUATIONS	51
R.F. Churchhouse, University College, Cardiff, U.K.	
3.1. Introduction	51
3.2. Systems of linear equations	53
3.3. Direct methods of solution	55
3.3.1. Gaussian elimination	56
3.3.2. Checking the accuracy of the solution	59

3.3.3.	The Gauss–Jordan method	61
3.3.4.	Systems of equations with several right-hand sides	63
3.4.	<i>Indirect methods: the Gauss–Seidel method</i>	65
3.4.1.	Formal definition of the Gauss–Seidel process	67
3.4.2.	Convergence of the Gauss–Seidel method	70
3.4.3.	Accelerating the convergence of the Gauss–Seidel process	72
3.4.4.	Jacobi's method	73
3.5.	<i>Ill-conditioned equations</i>	75
3.6.	<i>Comparison of the Gauss and Jordan methods</i>	77
3.6.1.	Analysis of the Gauss method	78
3.6.2.	Analysis of the Jordan method	80
4.	MATRIX COMPUTATIONS	83
	<i>I.M. Khabaza, Queen Mary College, London, U.K.</i>	
4.1.	<i>Motivation</i>	83
4.2.	<i>The Choleski methods</i>	84
4.3.	<i>Partitioned matrices</i>	90
4.4.	<i>Least squares methods</i>	91
4.5.	<i>Matrix inversion</i>	95
4.6.	<i>Eigenvalues and eigenvectors</i>	96
4.7.	<i>Norms for vectors and matrices</i>	100
4.8.	<i>Iterative methods for computing eigenvalues and eigenvectors</i>	108
4.9.	<i>Methods of computing eigenvalues for tridiagonal matrices</i>	111
4.10.	<i>Eigenvalues and eigenvectors of symmetric matrices</i>	118
4.11.	<i>Eigenvalues and eigenvectors of real unsymmetric matrices</i>	121
4.12.	<i>Miscellaneous methods</i>	129
5.	NON-LINEAR EQUATIONS	135
	<i>R.F. Churchhouse, University College, Cardiff, U.K.</i>	
5.1.	<i>Introduction</i>	135
5.2.	<i>Iterative methods</i>	136
5.3.	<i>Two-point iterative methods</i>	138
5.3.1.	The method of bisection	138
5.3.2.	The method of false position	140
5.3.3.	The secant method	143
5.4.	<i>One-point methods</i>	145
5.4.1.	The Newton–Raphson method	145
5.4.2.	Convergence of the Newton–Raphson method	150
5.4.3.	Order of convergence of iterative methods	151
5.4.4.	Halley's method	151
5.4.5.	Steffensen's method	152
5.5.	<i>The general one-point method</i>	153
5.6.	<i>Systems of non-linear equations</i>	157
6.	CURVE FITTING AND APPROXIMATION OF FUNCTIONS	163
	<i>R.F. Churchhouse, University College, Cardiff, U.K.</i>	
6.1.	<i>Introduction</i>	163
6.1.1.	Straight line approximation at discrete points	164
6.1.2.	Least squares fit of a straight line	165
6.1.3.	Least squares approximation by a polynomial	167
6.1.4.	Least squares approximation to a continuous function	170
6.1.5.	Disadvantage of least squares fitting with polynomials of high degree	174

6.1.6.	Least squares fit with other metrics	176
6.1.7.	Use of weightings	179
6.1.8.	Interpolation and numerical differentiation using least squares	180
6.2.	<i>Vector and matrix norms</i>	182
6.2.1.	Introduction	182
6.2.2.	The vector norms $\ x\ _p$	183
6.2.3.	Matrix norms	189
6.2.4.	Approximation to continuous functions using the norms L_1, L_2, L_∞	192
6.3.	<i>Approximations using orthogonal functions</i>	194
6.3.1.	Orthogonal functions	194
6.3.2.	The Legendre polynomials	196
6.3.3.	Least squares approximation by Legendre polynomials	199
6.3.4.	The Chebyshev polynomials	201
6.3.5.	Expansion as a series of Chebyshev polynomials	204
6.3.6.	Economization of power series by Chebyshev polynomials	208
6.3.7.	Use of Chebyshev polynomials over intervals other than $[-1, 1]$	210
6.3.8.	Chebyshev interpolation	212
6.3.9.	The Gram-Schmidt orthogonalization method	214
6.4.	<i>Non-polynomial approximation</i>	216
6.4.1.	General comments	216
6.4.2.	Rational approximations to given functions	219
6.4.3.	Padé approximations	220
6.4.4.	Rational approximation to given values	223
6.4.5.	Continued fractions	225
6.4.6.	Approximation to real numbers by continued fractions	227
6.4.7.	Analytical continued fractions	229
6.4.8.	A method of deriving continued fractions from series	231
6.4.9.	Fitting an exponential type function to given values	232
6.5.	<i>Splines and Hermite approximations</i>	234
6.5.1.	Splines	234
6.5.2.	Other end-conditions for splines	240
6.5.3.	Hermite approximation	241

7. QUADRATURE 245

A.M. Cohen, *University of Wales Institute of Science and Technology, Cardiff, U.K.*

7.1.	<i>Introduction</i>	245
7.1.1.	The Riemann sum	245
7.1.2.	Criteria for good quadrature techniques	246
7.1.3.	The trapezium rule	247
7.1.4.	The mid-point rule	249
7.1.5.	Simpson's rule	251
7.1.6.	Newton-Cotes formulae	253
7.2.	<i>Romberg integration</i>	253
7.2.1.	The variation of Lyness and McHugh	255
7.3.	<i>Gaussian quadrature</i>	256
7.3.1.	Gauss-Legendre quadrature	257
7.3.2.	The correction terms for Gauss-Legendre quadrature	260
7.3.3.	Gauss-Laguerre quadrature	263
7.3.4.	Gauss-Hermite quadrature	264
7.3.5.	Pseudo-Gaussian quadrature	264
7.4.	<i>Chebyshev methods</i>	265
7.5.	<i>Special integrals</i>	268
7.5.1.	Salzer's extrapolation method	268
7.5.2.	Oscillatory integrals	269

7.6. <i>Singular integrals</i>	273
7.6.1. Fox's extension of the method of Romberg integration	274
7.6.2. Gaussian quadrature formulae	276
7.6.3. Other techniques for singular integrals	277
7.6.4. Cauchy principal values	278
7.6.5. Integration of discontinuous functions	279
7.7. <i>Miscellaneous techniques</i>	280
7.7.1. Finite difference methods	280
7.7.2. Series expansions and transformations	283
7.7.3. Asymptotic expansions	286
7.7.4. Use of transforms	288
7.8. <i>The evaluation of multiple integrals</i>	289
7.8.1. Integration over hypercubes	289
7.8.2. Integration over general regions	294
7.9. <i>Summary</i>	296
<i>Appendices</i>	299
8. <i>ORDINARY DIFFERENTIAL EQUATIONS</i>	307
M.H. Rogers, University of Bristol, U.K.	
8.1. <i>Introduction: Existence of Analytic Solutions</i>	307
8.1.1. First-order equations: initial-value problem	308
8.1.2. Second-order equations: initial-value and boundary-value problems	311
8.1.3. Higher order equations	313
8.1.4. Linear equations	315
8.2. <i>Numerical solutions</i>	316
8.2.1. Euler's method	319
8.2.2. Runge-Kutta methods	321
8.2.3. Merson's method	325
8.2.4. Runge-Kutta-Fehlberg methods	326
8.2.5. Convergence of Runge-Kutta methods	330
8.2.6. Stability of Runge-Kutta methods	332
8.2.7. Inherent instability of Runge-Kutta methods	333
8.3. <i>Multistep methods</i>	335
8.3.1. Predictor-corrector methods	336
8.3.2. Accuracy and stability of multi-step methods	338
8.3.3. Conditional stability	339
8.3.4. Strong instability	342
8.3.5. Summary of stability properties of linear multi-step methods	343
8.3.6. Stability of multi-step methods applied to the Differential Equation $y' = Ay$	345
8.3.7. Variable order variable step multi-step methods	348
8.4. <i>Extrapolation methods</i>	348
8.5. <i>Methods for special equations</i>	350
9. <i>PARTIAL DIFFERENTIAL EQUATIONS</i>	355
D.E. Jones, University of Wales Institute of Science and Technology, Cardiff, U.K.	
9.1. <i>Introduction</i>	355
9.2. <i>Hyperbolic equations I—Method of characteristics</i>	359
9.3. <i>Hyperbolic equations II—Finite difference methods</i>	376
9.4. <i>Parabolic equations—Explicit and implicit methods</i>	381
9.5. <i>Elliptic equations</i>	391

10. INTEGRAL EQUATIONS	405
<i>A.M. Cohen, University of Wales Institute of Science and Technology, Cardiff, U.K.</i>	
10.1. <i>Linear integral equations</i>	405
10.1.1. Classification of linear integral equations	405
10.1.2. Connection with ordinary differential equations. Green's functions	406
10.1.3. The Liouville–Neumann series	409
10.1.4. Fredholm alternative theory	412
10.2. <i>Fredholm equations of the second kind</i>	419
10.2.1. Approximate solution	419
10.2.2. Error considerations	422
10.2.3. Singular kernels	430
10.3. <i>Volterra equations of the second kind</i>	435
10.3.1. Multi-step methods	436
10.3.2. Runge–Kutta type methods	439
10.3.3. Deferred corrections	441
10.3.4. Block-by-block methods	442
10.3.5. Stability of multi-step methods	443
10.4. <i>Integral equations of the first kind</i>	444
10.4.1. Volterra equations of the first kind. Theoretical approach	444
10.4.2. Volterra equations of the first kind	447
10.4.3. Fredholm equations of the first kind. Theoretical aspects	451
10.4.4. Fredholm equations of the first kind. Numerical techniques	453
10.5. <i>Eigenvalue problems</i>	455
10.6. <i>Miscellaneous topics</i>	460
10.6.1. Non-linear integral equations	460
10.6.2. Integro-differential equations	462
10.6.3. Iterative integral equations	464
APPENDICES	468
11. NUMERICAL OPTIMIZATION	475
<i>P.R. Turner, University of Lancaster, U.K.</i>	
11.1. <i>Single variable minimization</i>	475
11.2. <i>Functions of several variables</i>	482
11.3. <i>Gradient methods</i>	488
APPENDIX OF FORTRAN PROGRAMS	497
<i>A collection of programs in Fortran with listings, description and worked examples for some of the numerical methods described in the book.</i>	
INDEX	559

Volume IV ANALYSIS

INTRODUCTION	xix
1. SEQUENCES AND SERIES	1
<i>D.O. Tall, University of Warwick, U.K., and W. Leder mann, University of Sussex, U.K.</i>	
1.1. <i>Sequences</i>	1
1.2. <i>Convergent sequences</i>	2
1.3. <i>Divergent sequences</i>	9
1.4. <i>Increasing sequences</i>	10

1.5.	<i>Decreasing sequences</i>	12

5. FUNCTIONS OF SEVERAL (REAL) VARIABLES	175
I. Stewart, University of Warwick, U.K.	
5.0. Introduction	175
5.1. Two variables	175
5.2. Partial derivatives	178
5.3. Functions of n variables	180
5.4. The chain rule	182
5.5. Higher partial derivatives	184
5.6. Critical points	189
5.7. The Hessian	193
5.8. Taylor expansions	195
5.9. The derivative as a linear transformation	199
5.10. The derivative as a matrix	203
5.11. The chain rule in matrix language	209
5.12. The inverse function theorem	211
5.13. The implicit function theorem	215
5.14. Implicit differentiation	218
5.15. Constrained extrema and Lagrange multipliers	219
6. MULTIPLE INTEGRALS	225
P.L. Walker, University of Petroleum and Minerals, Dhahran, Saudi Arabia	
6.1. Line integrals	225
6.2. Double integrals in the plane	230
6.3. Surface integrals	238
6.4. Volume integrals	243
6.5. Extensions to higher dimension	248
7. ORDINARY DIFFERENTIAL EQUATIONS	249
P.J. Bushell, University of Sussex, U.K.	
7.1. Introduction	249
7.2. Linear equations of first order	251
7.3. Linear equations of n th order	253
7.3.1. General theory of the homogeneous equation	253
7.3.2. General theory of the non-homogeneous equation	255
7.3.3. Reduction of the order of a homogeneous equation	259
7.4. Linear equations with constant coefficients	260
7.4.1. The homogeneous equation	260
7.4.2. The non-homogeneous equation	261
7.5. Euler's equation	263
7.6. Linear equations of second order	264
7.6.1. Introduction	264
7.6.2. Solution by power series	266
7.6.3. Solution by definite integrals	272
7.6.4. Asymptotic forms of solutions to linear second order equations	275
7.6.5. Some useful transformations	276
7.7. Qualitative theory of the second-order linear equation	278
7.7.1. Introduction	278
7.7.2. Oscillatory behaviour	279
7.7.3. Bounds for solutions	283
7.8. Sturm–Liouville theory	286

7.8.1. Fourier series	286
7.8.2. Eigenfunction expansions	288
7.9. <i>First-order linear systems</i>	290
7.9.1. General theory	290
7.9.2. Linear systems with constant coefficients	293
7.9.3. Asymptotic form of solutions	296
7.10. <i>Non-linear first-order differential equations</i>	298
7.10.1. Introduction	298
7.10.2. Special equations	300
7.11. <i>Non-linear first-order systems</i>	304
7.11.1. General theory	304
7.11.2. Autonomous systems	306
7.11.3. Qualitative theory	307
7.11.4. Qualitative theory of two-dimensional systems	308
7.11.5. Stability theory	315
8. PARTIAL DIFFERENTIAL EQUATIONS	317
D.E. Edmunds, University of Sussex, U.K.	
8.0. <i>Introduction</i>	317
8.1. <i>Preliminaries</i>	318
8.2. <i>The Laplace operator</i>	324
8.3. <i>The heat operator</i>	337
8.4. <i>The wave operator</i>	341
8.5. <i>Elliptic, parabolic and hyperbolic linear equations</i>	350
8.6. <i>Non-linear problems</i>	361
8.6.0. Introduction	361
8.6.1. The Navier–Stokes equations	364
8.6.2. The Korteweg–de Vries equation	365
8.6.3. The porous medium equation	365
8.6.4. The equations of elasticity	365
8.6.5. Non-linear diffusion equations	365
8.6.6. Pseudo-differential operators	366
9. FUNCTIONS OF A COMPLEX VARIABLE	371
I. Stewart, University of Warwick, U.K.	
9.1. <i>Differentiation of complex functions</i>	372
9.2. <i>Paths in the complex plane</i>	375
9.3. <i>Integration</i>	378
9.4. <i>Cauchy's theorem</i>	381
9.5. <i>Power series</i>	385
9.6. <i>Taylor series</i>	388
9.7. <i>Laurent series</i>	390
9.8. <i>Poles and zeros</i>	392
9.9. <i>Residues</i>	394
9.10. <i>Evaluation of definite integrals</i>	397
9.10.1. Integrals of the form $\int_0^{2\pi} Q(\cos t, \sin t) dt$	397
9.10.2. Integrals of the form $\int_{-\infty}^{\infty} f(x) dx$	399
9.10.3. Integrals of the form $\int_{-\infty}^{\infty} f(x)e^{ix} dx$	402
9.10.4. Poles on the real axis	404
9.10.5. Integrals of the form $\int_{-\infty}^{\infty} (e^{ax}/\Phi(e^x)) dx$	406
9.11. <i>Summation of series</i>	407

9.12. Conformal transformations	410
9.13. Potential theory	413
9.14. The method of steepest descent	416
9.15. The method of stationary phase	419
9.16. The extended complex plane, or Riemann space	420
9.17. Riemann surfaces	423
10. SPECIAL FUNCTIONS	427
G.R. Walsh, University of York, U.K.	
10.1. <i>Jacobian elliptic functions and elliptic integrals</i>	427
10.1.0. Introduction	427
10.1.1. Jacobian elliptic functions	427
10.1.2. Elliptic integrals	432
10.1.3. Examples	434
10.1.4. Elliptic integrals of the first kind	438
10.1.5. Elliptic integrals of the second kind	440
10.1.6. Elliptic integrals of the third kind	443
10.1.7. Examples	445
10.1.8. Reduction of the general elliptic integral	451
10.2. <i>Gamma and beta functions</i>	453
10.2.0. Introduction	453
10.2.1. Definitions and elementary properties	453
10.2.2. Relation between beta and gamma functions	455
10.2.3. Integrals	456
10.2.4. Miscellaneous formulae	459
10.3. <i>Legendre polynomials</i>	460
10.3.0. Introduction	460
10.3.1. Laplace's equation in spherical polar coordinates	461
10.3.2. Legendre polynomials	462
10.3.3. Properties of Legendre polynomials	463
10.3.4. Examples	465
10.3.5. Legendre functions of the second kind	471
10.3.6. Associated Legendre functions	473
10.4. <i>Bessel functions</i>	475
10.4.0. Introduction	475
10.4.1. Laplace's equation in cylindrical polar coordinates	476
10.4.2. Bessel coefficients and functions	477
10.4.3. Modified Bessel functions	478
10.4.4. Properties of Bessel functions	481
10.4.5. Fourier–Bessel expansion	485
10.4.6. Examples	485
10.5. <i>Other functions</i>	489
10.5.0. Introduction: Orthogonal polynomials and the Sturm–Liouville equation	489
10.5.1. Laguerre polynomials	491
10.5.2. Hermite polynomials and functions	492
10.5.3. Chebyshev polynomials	494
Appendix A	501
Appendix B	501
Appendix C	502
11. METRIC SPACES	505
I. Stewart, University of Warwick, U.K.	
11.1. <i>Metric spaces: definition and examples</i>	505
11.2. <i>Open and closed subsets</i>	508

15.7. <i>Network optimization</i>	661
15.7.1. Maximal flow between two points of a network	661
15.8. <i>Miscellaneous methods</i>	663
15.8.1. Branch-and-bound methods	663
15.9. <i>Numerical methods for unconstrained optimization</i>	664
15.9.1. Types of method	664
15.9.2. Rates of convergence	665
15.9.3. Line search: the Newton-Raphson method	665
15.9.4. Golden section search	666
15.9.5. Fibonacci search	667
15.9.6. Gradient methods; Newton and quasi-Newton methods	668
15.9.7. Conjugate gradients	669
15.9.8. Variable-metric methods	670
15.10. <i>Numerical methods for constrained optimization</i>	671
15.10.1. Constrained maximization	671
15.10.2. A feasible direction method, especially suited for quadratic programming	671
15.10.3. Maximization of a general function subject to linear constraints	673
15.10.4. Penalty function and augmented Lagrangian methods	674
15.10.5. Variable-metric methods for non-linear constraints; Outline	675
15.10.6. Variable-metric methods for non-linear constraints; Description of the Biggs-Han-Powell Method	676
15.10.7. The cutting-plane method	678
16. DYNAMIC PROGRAMMING	681
J.A. Bather, University of Sussex, U.K.	
16.1. <i>Introduction</i>	681
16.2. <i>Multistage decision problems</i>	682
16.2.1. A general model	687
16.2.2. Applications	690
16.3. <i>Continuous models</i>	694
16.4. <i>Decisions involving uncertainty</i>	700
16.4.1. The secretary problem	700
17. CLASSICAL MECHANICS	705
K.J. Whiteman, University of Sussex, U.K.	
17.1. <i>Introduction</i>	705
17.2. <i>Vectors</i>	706
17.2.1. Definitions	706
17.2.2. Vector algebra	707
17.2.3. Vector products	710
17.2.4. Products of three vectors	713
17.2.5. Vector calculus	714
17.3. <i>Vectorial mechanics</i>	716
17.3.1. Velocity and acceleration	716
17.3.2. Rotating frames of reference	717
17.3.3. Motion of a single particle	718
17.3.4. Motion of a system of particles	720
17.3.5. Motion in a rotating frame of reference	722
17.4. <i>Analytical mechanics</i>	723
17.4.1. Constraints	723
17.4.2. Lagrange's equations	724
17.4.3. Hamilton's principle	726
17.4.4. Ignorable co-ordinates and invariants	727

17.4.5. Small oscillations about a position of equilibrium	728
17.4.6. Hamilton's equations	730
17.4.7. Canonical transformations	734
17.4.8. Hamilton-Jacobi theory	736
18. STOCHASTIC DIFFERENTIAL EQUATIONS	739
D.J. Wright, University College, Bangor, U.K.	
18.1. <i>Introduction</i>	739
18.1.1. Examples of random systems	739
18.1.2. Dynamic equations for random systems	742
18.1.3. Use of the Wiener process to represent random effects	743
18.2. <i>Stochastic integrals</i>	744
18.2.1. Definitions of stochastic integrals	744
18.2.2. Desirable properties of the Ito integral	745
18.2.3. Examples of stochastic integral involving Wiener process	746
18.2.4. Stochastic integrals with respect to the Poisson process	748
18.3. <i>Stochastic calculus</i>	748
18.3.1. Differential rules	748
18.3.2. Relations between ordinary and stochastic differential equations	751
18.3.3. Analytic solutions of stochastic differential equations	754
18.4. <i>Computer simulation</i>	754
18.4.1. Wiener case	756
18.4.2. Poisson case	757
18.5. <i>Applications</i>	758
18.5.1. Stochastic control	758
18.5.2. Non-linear filtering	758
18.5.3. Linear systems with random parameters	760
18.5.4. Financial modelling	760
18.5.5. Population dynamics	761
18.5.6. Other applications	762
18.6. <i>Conclusion</i>	762
19. FUNCTIONAL ANALYSIS	765
I. Marek, Univerzita Karlova, Prague, Czechoslovakia	
19.1. <i>Remarks on vector spaces and linear operators</i>	765
19.1.1. Vector spaces	766
19.1.2. Linear operators	768
19.2. <i>Normed vector spaces and their maps</i>	768
19.2.1. Normed vector spaces	768
19.2.2. Spaces of linear operators	773
19.2.3. Three fundamental principles	775
19.2.4. Operators on Hilbert spaces	777
19.3. <i>Spectral properties of linear operators</i>	778
19.3.1. Motivation	778

Volume V COMBINATORICS AND GEOMETRY Part A

INTRODUCTION	xiii
1. ELEMENTARY GEOMETRY AND TRIGONOMETRY	1
S. Wylie, Cambridge, U.K.	
1.1. Plane geometry	1
1.1.1. Introduction	1
1.1.2. Parallel lines	1

1.1.3.	Triangles	1
1.1.4.	Polygons	4
1.1.5.	Quadrilaterals	4
1.1.6.	Areas	5
1.1.7.	Similarity	6
1.1.8.	Circles	8
1.1.9.	Units for angles	10
1.2.	<i>Coordinate geometry and trigonometry</i>	11
1.2.1.	Cartesian coordinates	11
1.2.2.	An example	14
1.2.3.	Trigonometry	16
1.2.4.	The solution of triangles	22
1.2.5.	Polar coordinates	23
1.2.6.	Changing the axes of Cartesian coordinates	25
1.3.	<i>Conics</i>	26
1.3.1.	Introduction	26
1.3.2.	The ellipse	28
1.3.3.	The parabola	30
1.3.4.	The hyperbola	31
1.3.5.	The general conic	32
2.	SOLID GEOMETRY AND SPHERICAL TRIGONOMETRY	37
	S. Wylle, Cambridge, U.K.	
2.1.	<i>Solids</i>	37
2.1.1.	Volumes of solids	37
2.1.2.	Polyhedra	38
2.1.3.	The regular solids	38
2.1.4.	Three-dimensional Cartesian coordinates	40
2.1.5.	Other coordinate systems	41
2.2.	<i>Vectors in three dimensions</i>	43
2.2.1.	Introduction	43
2.2.2.	Parametric vector equations for line and plane	44
2.2.3.	Unit vectors	47
2.2.4.	The scalar product	48
2.2.5.	The vector product	50
2.2.6.	Some examples	52
2.3.	<i>The sphere and spherical trigonometry</i>	54
2.3.1.	The sphere	54
2.3.2.	Spherical trigonometry	55
2.4.	<i>Quadrics</i>	58
2.4.1.	Central quadrics	58
2.4.2.	Non-central quadrics	63
2.5.	<i>Geometry in n dimensions</i>	64
2.5.1.	Vectors in n dimensions	64
2.5.2.	Unit vectors in n dimensions	66
2.5.3.	Lines, planes and hyperplanes	67
3.	CURVE SKETCHING	71
	D.A. Quadling, Cambridge Institute of Education, U.K.	
3.1.	<i>Introduction</i>	71
3.2.	<i>Some basic graphs</i>	72
3.2.1.	Power functions	72
3.2.2.	Circular functions	73
3.2.3.	The exponential function	74

3.2.4. The integer function	75
3.3. Transformations involving addition or multiplication by a constant	75
3.4. Other transformations	80
3.5. Combining graphs	86
3.5.1. Arithmetic mean	86
3.5.2. Difference	87
3.5.3. Sum	87
3.5.4. Product function	87
3.6. Some algebraic and analytical techniques	89
3.6.1. Expression as product	89
3.6.2. Expression as sum	90
3.6.3. Symmetries of graphs	90
3.6.4. Use of calculus	92
3.6.5. Limits, approximations and asymptotes	92
3.7. Some important classes of graph	93
3.7.1. Polynomial functions	93
3.7.2. Rational functions	93
3.7.3. Algebraic curves	94
3.7.4. Sigmoids	95
3.8. Graphs with parametric equations	96
3.9. Graphs with polar equations	100
3.9.1. Polar coordinates	100
3.9.2. Equations involving trigonometrical functions	100
3.9.3. Spirals	103
4. CONVEXITY	105
G.H. Lawden, University of Sussex, U.K.	
4.1. Introduction	105
4.2. Convex sets	106
4.2.1. Definitions and combinatorial properties	106
4.2.2. Separation and decomposition properties	112
4.2.3. Theorems of the alternative	115
4.2.4. Convex polytopes	118
4.3. Convex functions	122
4.3.1. Basic concepts	122
4.3.2. Differentiability properties of convex functions	124
4.4. Convex programming	128
4.4.1. General properties	128
4.4.2. Optimality conditions	131
5. TOPOLOGY	139
P. Hilton, State University of New York, U.S.A.	
5.1. Fixed point theorems	139
5.2. General topology	140
5.2.1. Standard, induced and metrizable topologies	140
5.2.2. Compactness	141
5.2.3. Neighbourhoods	142
5.2.4. Interiors	143
5.2.5. Closed sets	144
5.2.6. Connectedness	144
5.2.7. Bases	145
5.2.8. Product and quotient topologies	146
5.3. Simplexes, complexes and polyhedra	148

5.4. <i>The homology groups</i>	153
5.5. <i>The Lefschetz fixed point formula</i>	155
5.6. <i>Other fixed point theorems</i>	157
5.7. <i>The fundamental group</i>	159
5.7.1. Definition	159
5.7.2. Covering spaces	160
5.7.3. Connection with homology groups	160
5.7.4. Hurewicz theorem	163
5.7.5. Knots	164
5.8. <i>The classification of closed surfaces</i>	165
6. GRAPHS AND NETWORKS	169
N. Christofides, Imperial College of Science and Technology, U.K.	
6.1. <i>Introduction</i>	169
6.1.1. Some simple graph concepts	170
6.1.2. Matrix representation	172
6.1.3. Connectivity	174
6.2. <i>Trees</i>	175
6.2.1. The shortest spanning tree of a graph	176
6.2.2. Steiner trees	178
6.2.3. Directed trees	179
6.3. <i>Shortest paths</i>	180
6.3.1. Shortest path from s to t	180
6.3.2. Shortest path from s to t (General arc costs)	185
6.3.3. Shortest paths between all vertices (General arc costs)	187
6.4. <i>Flows in networks</i>	187
6.4.1. The maximum flow from s to t	188
6.4.2. Variations of the s to t maximum flow problem	193
6.4.3. Maximum flow between every pair of vertices	194
6.4.4. Minimum cost flow from s to t	195
6.4.5. Flows in graphs with gains	197
6.4.6. Transportation and assignment problems	197
6.5. <i>Matchings</i>	198
6.6. <i>Some other graph problems and their applications</i>	200
6.6.1. The travelling salesman problem	200
6.6.2. Location problems	201
6.6.3. Independent and dominating sets	202
7. TENSORS	207
J. Foster and J.A. Lawrie, University of Sussex, U.K.	
7.1. <i>Introduction</i>	207
7.2. <i>Cartesian tensors of rank 2</i>	208
7.2.1. Definition	208
7.2.2. Principal axes	210
7.2.3. Vector notation	210
7.2.4. The summation convention	210
7.3. <i>Cartesian tensors of any rank</i>	211
7.4. <i>Cartesian tensors of special form</i>	212
7.4.1. The unit tensor	212
7.4.2. The alternating tensor	212
7.4.3. Symmetric and anti-symmetric tensors	213
7.4.4. Isotropic tensors	213
7.5. <i>Algebra of Cartesian tensors</i>	214

7.5.1. Addition, subtraction and multiplication	214
7.5.2. Contraction	214
7.5.3. Products of vectors	215
7.5.4. Products of tensors of rank 2	215
7.5.5. Identities	216
7.5.6. The quotient rule	216
7.6. <i>Cartesian tensor fields</i>	217
7.6.1. Vector and tensor fields	217
7.6.2. Differentiation of fields	217
7.6.3. Grad, div and curl	218
7.7. <i>General tensor calculus</i>	218
7.8. <i>Tensor fields on manifolds</i>	219
7.8.1. Manifolds	219
7.8.2. Notation	219
7.8.3. Tensors of rank (r, s)	220
7.8.4. Special tensors	223
7.8.5. Tensor algebra	223
7.9. <i>Metric tensor fields</i>	225
7.9.1. Metric tensors and line elements	225
7.9.2. Lengths and angles	226
7.9.3. Associated tensors	226
7.9.4. Indefinite metric tensors	227
7.10. <i>Differentiation</i>	228
7.10.1. Connexions	228
7.10.2. Geodesics	230
7.10.3. Curvature	230
7.11. <i>Cartesian tensors revisited</i>	231
7.11.1. Contravariance and covariance	231
7.11.2. The connexion	232
7.11.3. Pseudo-cartesian tensors of special relativity	232
8. <i>CATASTROPHE THEORY</i>	235
T. Poston, <i>University of California, Santa Cruz, USA.</i>	
8.1. <i>Shapes in one variable</i>	235
8.2. <i>Shapes in several variables</i>	242
8.3. <i>Determinacy</i>	250
8.4. <i>Unfoldings</i>	256
8.5. <i>Catastrophes</i>	259
8.6. <i>Sample applications</i>	264
8.6.1. Fluid mechanics	264
8.6.2. Collapsing structures	268
8.6.3. Archaeology	272
9. <i>FINITE SPACES AND COMBINATORIAL DESIGNS</i>	277
S. Vajda, <i>University of Sussex, U.K.</i>	
9.1. <i>Finite fields and finite spaces</i>	277
9.2. <i>Finite planes</i>	282
9.3. <i>Balanced incomplete block designs</i>	282
9.3.1. Symmetric BIBDs	283
9.3.2. Construction of BIBDs	285
9.4. <i>Partially balanced incomplete block designs</i>	289
9.4.1. Construction of PBIBDs	290

9.4.2. PBIBDs with two associate classes	292
9.4.3. PBIBDs with many associate classes	293
9.5. Latin squares	295
9.5.1. Construction of a complete set of Latin squares	296
9.5.2. Graeco-Latin squares	299
9.5.3. Latin squares based on groups	300
9.5.4. Orthogonal arrays	300
9.5.5. Latin rectangles	303
10. PROJECTIVE GEOMETRY	305
D. Longohtetti, University of California, Santa Barbara U.S.A. and S. Vajda, University of Sussex, U.K.	
10.1. Background and overview	305
10.2. Extended Euclidean geometry	306
10.3. Duality	307
10.4. Coordinates	308
10.4.1. Homogeneous coordinates	308
10.4.2. Equations of lines	308
10.4.3. Equations of points	310
10.5. The projective plane	310
10.5.1. Perspectivities	311
10.5.2. Harmonic sets	313
10.5.3. Projectivities	314
10.5.4. Projectivities on the same line. Involutions	317
10.6. Conic sections	319
10.6.1. Generating conic sections	319
10.6.2. Conic sections and the line at infinity	320
10.6.3. Theorems of Pascal and Brianchon	321
10.7. The projective space	322
10.7.1. Homogeneous coordinates in three dimensions	322
10.7.2. Ruled surfaces	325
10.8. Closing note	327
INDEX	xix

Volume V COMBINATORICS AND GEOMETRY Part B

INTRODUCTION	xiii
11. SYMMETRY	329
G. Jones, University of Southampton, U.K.	
11.1. Introduction	329
11.2. Finite isometry groups	334
11.2.1. Introduction	334
11.2.2. Cyclic and dihedral groups	335
11.2.3. Regular solids and their groups	341
11.2.4. Classification of finite rotation and isometry groups in \mathbb{R}^3	347
11.2.5. Higher dimensions	351
11.3. Crystallographic groups	355
11.3.1. Translations	355
11.3.2. Frieze groups	357
11.3.3. Wallpaper groups	359
11.3.4. Three-dimensional crystallographic groups	364

11.4. The isometry groups of \mathbb{R}^n	368
11.4.1. Orthogonal transformations	368
11.4.2. Isometries of \mathbb{R}^n	372
11.4.3. Discrete translation groups	374
11.5. Symmetries of functions	375
11.5.1. Introduction and definitions	375
11.5.2. Even and odd functions	377
11.5.3. Periodic functions	381
11.5.4. Elliptic functions	383
11.5.5. Symmetric functions	386
11.6. Symmetries and group representations	387
11.6.1. Introduction and elementary examples	387
11.6.2. Even and odd functions revisited	390
11.6.3. Symmetric functions revisited	391
11.6.4. Products of representations	393
11.7. Representations of some symmetry groups	399
11.7.1. Representations of $SO(2)$	399
11.7.2. Representations of $SO(3)$	402
11.7.3. Untwisting rotations	407
11.7.4. Möbius transformations and $SU(2)$	410
11.7.5. Representations of $SU(2)$	415
11.7.6. The Lorentz group	417
12. DIFFERENTIAL GEOMETRY	423
C. C. Hsiung, <i>Lehigh University, U.S.A.</i> and J. Foster, <i>University of Sussex, U.K.</i>	
12.1. Introduction	423
12.2. Curves	423
12.2.1. Parametric representations	423
12.2.2. Frenet formulae	427
12.2.3. Local canonical form and osculating figures	430
12.2.4. Curvature of plane curves	433
12.2.5. Involutives and evolutes	434
12.3. Surfaces and fundamental forms	436
12.3.1. Parametric representations	436
12.3.2. Surfaces of revolution and cylinders	438
12.3.3. Fundamental forms	441
12.4. Curvature of a surface	443
12.4.1. Curvature of curves on a surface	443
12.4.2. Local form of a surface	444
12.4.3. Principal curvatures and Dupin indicatrix	446
12.4.4. Gaussian and mean curvatures; lines of curvature and asymptotic curves	450
12.5. Fundamental equations of surface theory	453
12.5.1. Weingarten formulae	453
12.5.2. Equations of Gauss	454
12.5.3. Mainardi-Codazzi equations and the Gauss equation	456
12.5.4. Intrinsic and extrinsic properties	457
12.6. Parallelism and geodesics	458
12.6.1. Levi-Civita parallelism	458
12.6.2. Developables	461
12.6.3. Geodesic curvature	461
12.6.4. Geodesics	462
12.7. Global properties	464
12.7.1. Total curvature of a curve	464
12.7.2. Orientability of a surface	465
12.7.3. Total curvature of a surface and Gauss-Bonnet theorem	466

13. VECTORS	469
W. Ledermann, University of Sussex, U.K.	
13.1. Introduction	469
13.2. Vectors in affine space	469
13.2.1. Operations on vectors	469
13.2.2. Linear dependence and dimension	473
13.2.3. Coordinates	476
13.2.4. Examples	477
13.3. Vector algebra in Euclidean 3-space	479
13.3.1. The inner products	479
13.3.2. Cartesian coordinates	483
13.3.3. Orientation	484
13.3.4. Computation of the inner product	485
13.3.5. The vector product	486
13.3.6. Multiple products	490
13.3.7. Change of axes	493
13.4. Vector calculus	495
13.4.1. Vector functions of a single variable	495
13.4.2. Vector fields; differentiation	497
13.4.3. The nabla operator	501
13.5. Integral formulae	502
13.6. Curvilinear coordinates	510
13.6.1. Generalized coordinates	510
13.6.2. Orthogonal curvilinear coordinates	511
14. ANALYTIC MANIFOLDS AND LIE GROUPS	517
P. Hilton, State University of New York, U.S.A.	
14.1. Manifolds	517
14.2. Analytic functions, tangent vectors and differentials	519
14.3. Vector fields and differential forms	521
14.4. Topological groups	522
14.5. Lie groups	525
14.6. Lie algebras	526
14.7. The exponential map	528
15. ENUMERATION	531
E.K. Lloyd, University of Southampton, U.K.	
15.1. Introduction	531
15.2. Combinations and permutations	532
15.2.1. Combinations (subsets)	532
15.2.2. Combinations with repetitions (multisets)	534
15.2.3. Ordered choices	535
15.2.4. Permutations	536
15.3. Inclusion-exclusion	538
15.4. Generating functions	542
15.4.1. Subset generators (combinations without repetitions)	543
15.4.2. Multiset generators (combinations with repetitions)	544
15.4.3. Numerical generators for subsets and multisets	546
15.4.4. Permutation generators	548
15.4.5. Exponential generators for permutations	550
15.5. Recurrence relations	552
15.5.1. Examples of recurrences in enumeration	552
15.5.2. Linear recurrence relations	556

15.5.3. Solutions by generating functions	558
15.5.4. Circular permutations	563
15.6. <i>Matrix methods</i>	564
15.6.1. Distinct representatives	564
15.6.2. Permanents	566
15.6.3. Generating SDRs and permutations with positional restrictions	570
15.6.4. Multiset permutations with adjacency restriction	575
15.6.5. Positional and adjacency restriction	581
15.7. <i>Enumeration and symmetry groups</i>	582
15.7.1. Introduction	582
15.7.2. Counting orbits	585
15.7.3. The Redfield-Pólya theorem	588
15.8. <i>Inversion formulae</i>	592
15.8.1. Introduction	592
15.8.2. Inversion in posets	594
15.8.3. Stirling numbers	600
15.9. <i>Partitions and symmetric functions</i>	602
15.9.1. Partitions	602
15.9.2. Plane partitions	607
15.9.3. Symmetric functions	610
15.9.4. Hammond operators	614
15.9.5. Distribution problems	616
16. CODING THEORY	623
J. L. Massey, Institut für Fernmeldetechnik, ETH, Zürich, Switzerland.	
16.1. <i>Introduction</i>	623
16.1.1. Repetition codes	623
16.1.2. Block codes and Hamming metric	624
16.1.3. Hamming and Gilbert bounds	625
16.2. <i>Linear codes</i>	627
16.2.1. Generator and parity check matrices	628
16.2.2. Weight and distance structure	630
16.2.3. Gilbert and Varshamov bounds	633
16.2.4. Error detection and the MacWilliams' identity	635
16.2.5. Cyclic codes	638
16.2.6. Syndrome decoding	642
16.3. <i>Some important linear codes</i>	643
16.3.1. Reed-Solomon (RS) codes	644
16.3.2. Discrete Fourier Transform	647
16.3.3. Decoding Reed-Solomon codes	649
16.3.4. Bose-Chaudhuri-Hocquenghen (BCH) codes	651
16.3.5. Binary cyclic Reed-Mullen (RM) codes	655
16.4. <i>Very long codes</i>	662
16.4.1. Justesen codes	663
16.4.2. Concatenated codes	665
16.5. <i>Convolutional codes</i>	666
16.5.1. Distance and equivalence notions	666
16.5.2. Encoding considerations	669
16.5.3. Code constructions	672
17. PATTERNS	677
B. Grünbaum, University of Washington, U.S.A. and G.C. Shephard, University of East Anglia, U.K.	
17.1. <i>Introduction</i>	677
17.2. <i>Plane patterns</i>	678

17.2.1. Disk patterns and symmetry types	679
17.2.2. The henomeric classification	680
17.2.3. Enumeration of henomeric types of disk patterns	686
17.2.4. Some other kinds of plane patterns	696
17.2.5. The homeomeric classification	698
17.2.6. Patterns whose motifs are not closed sets	705
17.3. <i>Patterns on a 2-sphere</i>	714
17.3.1. Symmetry groups	715
17.3.2. Spherical disk patterns	715
17.4. <i>Conclusions</i>	726
17.4.1. General remarks	726
17.4.2. Historical notes	727
17.5. <i>Bibliography</i>	730
INDEX	xix

Volume VI STATISTICS Part A

INTRODUCTION	xvii
1. INTRODUCTION TO STATISTICS	1
E. Lloyd, University of Lancaster, U.K.	
1.1. <i>The meaning of the word 'statistics'</i>	1
1.2. <i>Sampling distribution; statistic; estimate</i>	4
1.3. <i>The subject-matter of this book</i>	7
1.3.1. Sampling distributions; distribution-free methods	8
1.3.2. Estimates, tests, decisions	9
1.3.3. Bayesian inference	12
1.3.4. Multivariate analysis	13
1.3.5. Time series	13
1.3.6. Bibliography and references	13
1.3.7. Appendix: statistical tables	14
1.3.8. Some topics that are not covered	14
1.4. <i>Conventions and notations</i>	15
1.4.1. Mathematical conventions	15
1.4.2. Statistical and probabilistic conventions and abbreviations (i) Abbreviations; (ii) Nomenclature of standard distributions; (iii) capital letter convention for random variables; (iv) Notation for moments and related quantities; (v) Non-standard usages: induced r.v., statistical copy; (vi) An ambiguity in the meaning of $P(A/K)$: 'the probability of A on K'; (vii) Nomenclature for tabular values: percentage points	15
1.5. <i>Further reading</i>	18
2. SAMPLING DISTRIBUTIONS	19
E. Lloyd, University of Lancaster, U.K.	
2.1. <i>Moments and other statistics</i>	19
2.1.1. Statistics	19
2.1.2. Moments	22
(a) Population moments; (b) Sample moments; (c) Sample variance and sample standard deviation; (d) Bivariate samples	
2.2. <i>Sampling distributions; introductory definitions and examples</i>	26
2.3. <i>Sampling moments of a statistic</i>	29
2.3.1. Lower sampling moments of the sample mean	30
2.3.2. Lower sampling moments of the sample variance	30

2.3.3.	Sampling covariance between the sample mean \bar{x} and the sample variance v	31
2.3.4.	Sampling moments of higher sample moments	32
2.3.5.	Sampling moments of the sample standard deviation	32
2.3.6.	Sampling moments of the sample skewness	32
2.4.	<i>Distributions of sums of independent and identically distributed variables</i>	33
2.5.	<i>Sampling distributions of functions of Normal variables</i>	33
2.5.1.	The Normal distribution	33
2.5.2.	Effect of a linear transformation; standardization	34
2.5.3.	Linear functions of Normal variables	36
	(a) Linear functions of independent Normals	36
	(b) Sampling distribution of the sample mean	37
	(c) Linear function of correlated Normals	37
	(d) Several linear functions of correlated Normals	37
	(e) Independent linear functions of correlated Normals	38
	(f) Independent linear functions of i.i.d. Normals	38
2.5.4.	Quadratic functions of Normal variables	39
	(a) The chi-squared distribution. Sum of squares of independent standard Normals. Quadratic forms in Normal variables	39
	(b) Independence of the sample sum of squares and the sample mean in Normal samples	42
	(c) Tables of the χ^2 distribution	42
	(d) Sampling distribution of the sample variance	44
	(e) Sampling distribution of the sample standard deviation	45
2.5.5.	Student's distribution (the 't distribution')	48
2.5.6.	The variance ratio (F) distribution	50
	(a) F as a weighted ratio of χ^2 variables	50
	(b) Relation between the F distribution and the Beta distribution	52
	(c) Approximation to the F distribution when one degree of freedom is very much larger than the other	52
2.5.7.	The sample correlation coefficient	53
2.5.8.	The independence of quadratic forms: the Fisher-Cochran theorem; Craig's theorem	55
2.5.9.	The range and the Studentized range	58
2.6.	<i>Approximate sampling distribution of \bar{x} and of non-linear functions of \bar{x}</i>	59
2.7.	<i>Approximation to sampling expectation and variance of non-linear statistics; variance-stabilizing transformations; Normalizing transformations</i>	61
2.7.1.	Approximations	61
	(a) Functions of a single r.v.	61
	(b) Functions of two random variables	63
2.7.2.	Variance-stabilizing transformations	64
	(a) A general formula	64
	(b) Poisson data: the square root transformation	65
	(c) Binomial data: the arc sine (or angular) transformation	66
	(d) Stabilizing the variance of a regressed variable by weighting	66
2.7.3.	Normalizing transformations	67
	(a) The log transform: positively skewed positive variables	67
	(b) The log transform for variables bounded above and below; the inverse hyperbolic tangent transformation for the correlation coefficient	67
	(c) Normalizing transforms of χ^2	68
	(d) The probability integral transform: probits	69
2.7.4.	Curve-straightening transformations	70
2.7.5.	A Student-distributed transform of the sample correlation coefficient when $p = 0$	71
2.7.6.	A χ^2 -distributed transform of a uniformly distributed variable	71

2.8.	<i>Non-central sampling distributions</i>	72
2.8.1.	Non-central chi-squared	72
2.8.2.	Non-central F	73
2.8.3.	The non-central Student distribution	73
2.9.	<i>The multinomial distribution in sampling distribution theory</i>	74
2.9.1.	Binomial, trinomial and multinomial (m) distributions (i) Binomial; (ii) Trinomial; (iii) Multinomial	74
2.9.2.	Properties of the multinomial (m)	76
	(a) Low-order moments	76
	(b) Marginal distributions	76
2.9.3.	The multinomial as a conditional of the joint distribution of independent Poisson variables	76
2.9.4.	Frequency tables	76
2.10.	<i>Further reading and references</i>	77
3.	ESTIMATION: INTRODUCTORY SURVEY	79
	E. Lloyd, University of Lancaster, U.K.	
3.1.	<i>The estimation problem</i>	79
3.2.	<i>Intuitive concepts and graphical methods</i>	84
3.2.1.	Introduction	84
3.2.2.	Frequency tables, histograms and the empirical c.d.f.	84
	(a) Discrete data	84
	(b) Bar chart and histogram of discrete data	87
	(c) Continuous data	90
	(d) Histogram of continuous data	92
	(e) Sample analogue of the c.d.f.; Probability graph papers	93
3.3.	<i>Some general concepts and criteria for estimates</i>	94
3.3.1.	Introduction: Dimension, exchangeability, consistency, concentration	94
	(a) Dimensions	95
	(b) Exchangeability	95
	(c) Consistency	96
	(d) Concentration (high local probability)	98
3.3.2.	Unbiased estimates and minimum-variance unbiased estimates	99
3.3.3.	Efficiency: the Cramér-Rao ('C-R') bound	103
	(a) The C-R inequality: random sample from a univariate one-parameter distribution	103
	(b) Attainment of the C-R bound. Efficiency of an estimate	106
	(c) Regularity conditions	108
	(d) The C-R inequality for independent vector observations on a 1-parameter multivariate distribution	109
	(e) The C-R inequality for observations that are not independent and/or not identically distributed	111
	(f) A generalization of the C-R inequality to the case of several parameters. The information matrix	111
3.4.	<i>Sufficiency</i>	114
3.4.1.	Definition of sufficiency	114
3.4.2.	The Factorization criterion and the exponential family	117
3.4.3.	Sufficiency and minimum-variance unbiased estimates	121
	(a) The Rao-Blackwell theorem	121
	(b) Minimum-variance unbiased estimates and sufficiency	123
3.4.4.	Sufficiency in the multi-parameter case	124
3.5.	<i>Practical methods of constructing estimates: an introduction</i>	125
3.5.1.	Graphical methods	125
3.5.2.	Minimum variance unbiased estimates and the method of least squares	128
3.5.3.	The method of moments	130

3.5.4. The method of maximum likelihood	132
3.5.5. Normal linear models in which maximum likelihood and least squares estimates coincide	135
3.6. <i>Further reading</i>	136
4. INTERVAL ESTIMATION	137
E Lloyd, University of Lancaster, U.K.	
4.1. <i>Introduction: the problem</i>	137
4.1.1. An intuitive approach	137
4.1.2. Standard error	139
4.1.3. Probability intervals	140
(a) Probability intervals for continuous random variables	140
(b) Probability intervals for discrete random variables	142
4.2. <i>Confidence intervals and confidence limits</i>	143
4.3. <i>Constructing a confidence interval by using a pivot</i>	147
4.4. <i>Factors affecting the interpretation of a confidence interval as a measure of the precision of an estimate</i>	149
4.5. <i>Confidence intervals when there are several parameters</i>	151
4.5.1. Individual confidence intervals	151
4.5.2. Confidence intervals for functions of two parameters, including the difference between parameters and the ratio of parameters. (Fieller's theorem)	156
4.6. <i>Construction of confidence intervals without using pivots</i>	162
4.7. <i>Approximate confidence intervals when the underlying distribution is discrete</i>	168
(a) <i>A crude approximation; (b) A better approximation</i>	169
4.8. <i>Distribution-free confidence intervals for quantiles</i>	175
4.9. <i>Multiparameter confidence regions</i>	176
4.9.1. Exact confident regions	176
4.9.2. Elliptical confidence regions for the expectation vector of a bivariate Normal distribution; and approximate confidence regions for a pair of maximum likelihood estimates	182
4.10. <i>Confidence interval obtainable from a large sample, using the likelihood function</i>	184
4.10.1. The likelihood function	184
4.10.2. Approximate confidence intervals, using the derivative of the log-likelihood	186
4.10.3. Confidence intervals obtained with the aid of an (approximately) Normalizing transformation	188
4.11. <i>Confidence band for an unknown continuous cumulative distribution function</i>	189
4.11.1. The empirical c.d.f.	189
4.11.2. The Kolmogorov-Smirnov distance between the c.d.f. and the empirical c.d.f.	191
4.11.3. The sampling distribution of the Kolmogorov-Smirnov statistic; confidence limits for the c.d.f.	192
4.12. <i>Tolerance intervals</i>	195
4.13. <i>Likelihood intervals</i>	196
4.13.1. Likelihood	196
(a) Likelihood and log-likelihood: definitions and examples	196
(b) Likelihood and sufficiency	199
4.13.2. Plausible values and likelihood intervals	200
(a) Equiplausible values of θ	200
(b) One value of θ more plausible than another	200

(c) conventionally implausible values of θ : likelihood intervals	201
(d) Likelihood intervals for θ and for $g(\theta)$	205
4.13.3. The two-parameter case	205
4.14. Bayesian intervals	206
4.15. Further reading and references	207
5. STATISTICAL TESTS	209
E. Lloyd, University of Lancaster, U.K.	
5.1. What is meant by a significance test?	209
5.2. Introduction to tests involving a simple null hypothesis in discrete distributions	209
5.2.1. A two-sided (Binomial) test: ingredients, procedure and interpretation	210
(a) Probability model	210
(b) Condensing the data: the test statistic	210
(c) Null hypothesis, null distribution	211
(d) Alternative hypothesis	212
(e) Compatibility of sample with H	212
(f) Significance set, significance level (significance probability). Critical region	213
(f_1) distance ordering	214
(f_2) probability ordering	214
(f_3) likelihood ratio ordering	216
(g) Interpretation of the significance level	218
(h) Strength of evidence	219
5.2.2. Conventional interpretation of significance levels; practices used in specifying significance levels; Critical region	219
5.2.3. A one-sided (Binomial) test	221
5.2.4. Tests with Poisson distributions	222
5.2.5. Tests with continuous distributions	222
5.2.6. Choosing a test statistic	225
5.3. Criteria for a test	227
5.3.1. Sensitivity function	227
5.3.2. Sensitivity function of the one-tailed test when σ is unknown, in a sample from a Normal (θ, σ) distribution	231
5.3.3. Sensitivity function of a two-tailed test	233
5.4. Tests involving a composite null hypothesis	235
5.4.1. Conditional tests: equality of Binomial proportions; ratio of Poisson parameters	235
5.4.2. Tests for independence in 2×2 contingency tables; Fisher's 'Exact Test'	241
5.5. Tests involving more than one parameter; generalized likelihood ratio tests	247
5.6. Large sample approximation to the significance level of a likelihood ratio test	251
5.7. Randomization tests	254
5.8. Standard tests with the Normal distribution model	255
5.8.1. The significance of a sample mean when the variance is known	255
5.8.2. The significance of a mean when the variance is unknown: Student's t -test	256
5.8.3. The Fisher-Behrens test for the significance of the difference between two means	259
5.8.4. The t -test for the significance of the difference between two means (variances being equal)	261
5.8.5. The t -test for the significance of a regression coefficient in simple linear regression	262
5.8.6. Test for the equality of two variances	264

5.8.7. Tests for the equality of several means: introduction to the analysis of variance	266
(a) Introduction	266
(b) Comparison of two means as analysis of variance	266
(c) The case of k samples	269
5.9. <i>Tests for Normality</i>	272
5.10. <i>Test for the equality of k variances (Bartlett's test)</i>	275
5.11. <i>Combining the results of several tests</i>	277
5.12. <i>Neyman-Pearson theory</i>	278
5.12.1. Sampling inspection schemes	278
5.12.2. The Neyman-Pearson theory of tests	278
5.13. <i>Further reading and references</i>	282
6. MAXIMUM-LIKELIHOOD ESTIMATES	283
E. Lloyd, University of Lancaster, U.K.	
6.1. <i>Introduction</i>	283
6.2. <i>The method of maximum likelihood</i>	284
6.2.1. The likelihood and log-likelihood functions	284
6.2.2. The maximum likelihood estimate (MLE)	293
6.2.3. MLE: intuitive justification	295
6.2.4. MLE: kinds of maxima	296
6.2.5. Theoretical justification: for the MLE properties of the likelihood function	297
(a) Asymptotic distribution of the derivative of the log-likelihood function	297
(b) Confidence interval for an estimated parameter: first method	299
(c) The principal practical approximation for the sampling distribution of the MLE	302
(d) Confidence intervals and confidence regions: second method	303
6.2.6. Estimating a function of θ . Invariance	304
6.3. <i>Examples of ML estimation in one-parameter cases</i>	305
6.4. <i>Examples of MLE in multi-parameter cases</i>	314
6.5. <i>Maximum likelihood estimation of linear regression coefficients</i>	321
6.5.1. The meaning of 'regression'	321
6.5.2. The MLE procedure for linear regression with weighted data	324
6.5.3. Linear regression with equally weighted data	324
(i) The estimate; (ii) Sampling properties of the estimates; (iii) Confidence intervals for α and β ; (iv) Significance tests for α and β ;	
(v) Confidence interval for $y(x)$	
6.6. <i>Estimation of dosage-mortality relationship</i>	333
6.6.1. Quantal responses	333
6.6.2. Probability model	335
6.6.3. The likelihood surface	338
6.6.4. The maximum likelihood estimator	340
6.6.5. Reliability of the estimates	343
6.6.6. Dose required for a specified response	346
6.7. <i>Maximum likelihood estimates from grouped, censored or truncated data</i>	348
6.7.1. Discrete data	348
(i) Truncation; (ii) Grouping, censoring	
6.7.2. Continuous data: grouping. Sheppard's correction	350
6.8. <i>Further reading</i>	352
7. CHI-SQUARED TESTS OF GOODNESS OF FIT AND OF INDEPENDENCE AND HOMOGENEITY	355
E. Lloyd, University of Lancaster, U.K.	
7.1. <i>Validity of the model</i>	355

7.1.1.	Introduction	355
7.1.2.	Adequacy of the linear regression model	357
7.2.	<i>Karl Pearson's distance statistic: the χ^2 test</i>	358
7.3.	<i>Amalgamating low frequency cells: Cochran's criteria</i>	365
7.4.	<i>The χ^2 test for continuous distributions</i>	365
7.5.	<i>Cross-classified frequency tables (contingency tables). Tests of independence and of homogeneity</i>	370
7.5.1.	<i>2 × 2 tables; the special case of a single degree of freedom</i>	370
7.5.2.	<i>k × m tables</i>	377
7.6.	<i>Index of dispersion</i>	379
7.6.1.	<i>Index of dispersion for Binomial samples</i>	379
7.6.2.	<i>Index of dispersion for Poisson samples</i>	380
7.7.	<i>Further reading and references</i>	381
8.	LEAST SQUARES ESTIMATION AND THE ANALYSIS OF VARIANCE	383
	D. Warren, University of Lancaster, U.K.	
8.1.	<i>Least squares estimation for general models</i>	383
8.2.	<i>Least squares estimation for full-rank linear models, Normal equations. The Gauss-Markov theorem</i>	384
8.2.1.	<i>Examples of least squares estimation</i>	384
8.2.2.	<i>Matrix formulation for linear models</i>	385
8.2.3.	<i>Properties of least squares estimates</i>	390
8.2.4.	<i>Residuals</i>	393
8.2.5.	<i>Orthogonal designs and orthogonal polynomials</i>	396
8.2.6.	<i>Modifications for observations of unequal accuracy; weighted least squares</i>	401
8.2.7.	<i>Modification for non-independent observations</i>	403
8.3.	<i>Analysis of variance and tests of hypotheses for full-rank designs</i>	404
8.3.1.	<i>Normal theory</i>	404
8.3.2.	<i>Confidence regions</i>	405
8.3.3.	<i>Testing hypotheses</i>	407
8.3.4.	<i>The basic identities</i>	408
8.3.5.	<i>Tests of hypotheses in orthogonal designs</i>	410
8.3.6.	<i>Hypothesis testing in non-orthogonal designs</i>	417
8.3.7.	<i>Group orthogonality</i>	427
8.3.8.	<i>The general linear hypothesis</i>	429
8.4.	<i>Further reading</i>	436
9.	THE DESIGN OF COMPARATIVE EXPERIMENTS	437
	E. Lloyd, University of Lancaster, U.K.	
9.1.	<i>Historical introduction</i>	437
9.2.	<i>The tea-tasting lady</i>	438
9.3.	<i>A more elaborate example: Darwin's experiment</i>	440
	<i>(i) Blocking; (ii) Replication, (iii) Balance; (iv) Randomization</i>	440
9.4.	<i>Complete randomized block designs</i>	442
9.5.	<i>Treatments at one level, and at several levels</i>	443
9.6.	<i>The need for devices to reduce block size</i>	443
9.7.	<i>Balanced incomplete blocks for comparing single-level treatments</i>	444
9.8.	<i>The complete factorial design</i>	445
9.8.1.	<i>Main effects and interaction: two factors at two levels</i>	446
9.8.2.	<i>Main effects and interactions: three factors at two levels</i>	448
9.8.3.	<i>Main effects and interactions in a 2^t design</i>	450
9.9.	<i>Incomplete blocks; confounding</i>	451
9.10.	<i>Partial confounding</i>	453

9.11. <i>Factors at three or more levels</i>	454
9.11.1. The Latin square	454
9.11.2. The Graeco-Latin square	456
9.12. <i>Further reading and references</i>	457
10. LEAST SQUARES AND THE ANALYSIS OF STATISTICAL EXPERIMENTS: SINGULAR MODELS; MULTIPLE TESTS	459
D. Warren, University of Lancaster, U.K.	
10.1. <i>Singular models</i>	459
10.1.1. Introduction	459
10.1.2. Estimation. Estimable functions	461
10.1.3. Tests of hypotheses	465
10.1.4. The two-way hierarchical classification	470
10.1.5. The two-way cross-classification	473
10.1.6. Higher order classifications	480
10.1.7. Analysis of covariance	484
10.2. <i>Multiple tests and comparisons</i>	488
10.2.1. Introduction	488
10.2.2. Combination of tests, and overall size	489
10.2.3. Multiple comparisons	491
10.3. <i>The assumptions about the errors</i>	496
10.3.1. The basic assumptions	496
10.3.2. Residual analysis	497
10.4. <i>Further reading and references</i>	498
APPENDIX	A1

Volume VI STATISTICS Part B

INTRODUCTION	xv
11. LINEAR MODELS I	499
J. Whittaker, University of Lancaster, U.K.	
11.1. <i>Describing the model</i>	499
11.1.1. Elements of linear algebra	501
11.1.2. A Binomial-Logistic model	504
11.1.3. The general linear model	506
11.1.4. A Normal-Identity model	507
11.1.5. The linear predictor and the link function	508
11.1.6. The density function	509
11.1.7. The likelihood function for the exponential family	511
11.1.8. The Binomial-Logistic example	512
11.2. <i>Fitting a model to the data</i>	513
11.2.1. The data structure	513
11.2.2. The likelihood function and its maximum	514
11.2.3. The deviance	517
11.2.4. Regression through the origin	518
11.2.5. Partitioning the deviance	520
11.3. <i>Model specification and selection</i>	522
11.3.1. Subspaces	522
11.3.2. Model formulae for the linear predictor	524
11.3.3. Models for qualitative data	526
11.3.4. The factors: main effects and interaction	528

11.3.5. A two-factor model for a two-way analysis of variance model	530
11.3.6. Factorial models for cross-classified data	533
11.3.7. Mixed models	536
11.3.8. Factors with ordered levels	538
<i>11.4. Contingency tables</i>	540
11.4.1. Sampling models for contingency tables	540
11.4.2. Independence models for the linear predictor	542
11.4.3. Three-way independence models	545
11.4.4. Response and treatment factors	546
<i>11.5. Further reading and references</i>	547
12. LINEAR MODELS II	549
J. Whittaker, University of Lancaster, U.K.	
<i>12.1. Least squares</i>	549
12.1.1. Introductory ideas on Least squares	549
12.1.2. Least squares in 2-space	551
12.1.3. Maximum likelihood estimation for the Normal density	553
12.1.4. Least squares on two explanatory variables	554
12.1.5. The non-orthogonal case	557
12.1.6. Extensions to further explanatory variables	560
<i>12.2. Repeated sampling</i>	561
12.2.1. Normal distribution theory	561
12.2.2. First and second moments	562
12.2.3. One explanatory variable	563
12.2.4. Two orthogonal explanatory variables	566
12.2.5. Non-orthogonal explanatory variables	568
<i>12.3. Least squares and the likelihood function</i>	571
12.3.1. Weighted least squares	571
12.3.2. Approximating the likelihood function	572
12.3.3. Example: fitting an independence model	574
12.3.4. An exponential example	575
12.3.5. An iterative procedure	576
12.3.6. Asymptotic sampling theory	576
<i>12.4. Further reading and references</i>	577
13. SEQUENTIAL ANALYSIS	579
P.W. Jones, University of Keele, Staffordshire U.K.	
<i>13.1. Sequential tests of hypotheses</i>	580
13.1.1. The Operating Characteristic (O.C.) function	580
13.1.2. Expected sample size	581
13.1.3. Examples of sampling inspection schemes	581
<i>13.2. The sequential probability ratio test (SPRT)</i>	583
13.2.1. Approximate values for the stopping boundaries	583
13.2.2. Examples	585
<i>13.3. The O.C. function of the SPRT</i>	588
<i>13.4. Expected sample size for the SPRT</i>	590
<i>13.5. Examples</i>	591
<i>13.6. The SPRT for composite hypotheses</i>	594
<i>13.7. Tests involving two Binomials</i>	596
13.7.1. Wald's method	597
13.7.2. Armitage's method	597
13.7.3. Discussion	600
<i>13.8. Other sequential procedures</i>	600

13.8.1. Sequential designs for the 'Two-Binomials' problem	600
13.8.2. Bayesian methods	601
13.9. <i>Further reading and references</i>	601
14. DISTRIBUTION-FREE METHODS	603
I. Dunsmore, University of Sheffield, UK	
14.1. <i>Introduction</i>	603
14.2. <i>Tests based on the empirical distribution function</i>	604
14.2.1. The Kolmogorov-Smirnov test: one sample	606
14.2.2. The Kolmogorov-Smirnov test: two samples	608
14.3. <i>Tests based on order statistics</i>	610
14.4. <i>One-sample tests</i>	611
14.4.1. Sign test	611
14.4.2. The Wilcoxon signed ranks test	613
14.5. <i>Matched pairs</i>	615
14.6. <i>Two-sample tests</i>	615
14.6.1. The two-sample median test	616
14.6.2. The Wilcoxon-Mann-Whitney test	618
14.6.3. Runs	621
14.7. <i>Several samples</i>	623
14.7.1. Median test	623
14.7.2. The Kruskal-Wallis test	624
14.8. <i>Randomization tests</i>	626
14.9. <i>Rank correlation measures</i>	628
14.9.1. Spearman's rank correlation coefficient	628
14.9.2. Kendall's rank correlation coefficient	629
14.10. <i>Further reading and references</i>	631
15. BAYESIAN STATISTICS	633
A.F.M. Smith, University of Nottingham, U.K.	
15.1. <i>Introduction</i>	633
15.2. <i>Bayes' theorem: the discrete case</i>	635
15.2.1. Learning from a single data set	635
15.2.2. Learning from several data sets	639
15.2.3. Bayes' theorem expressed in terms of odds	643
15.2.4. Extension to an infinite list of possible models	644
15.3. <i>Bayes' theorem: the continuous case</i>	644
15.3.1. The continuous form of Bayes' theorem	644
15.3.2. The assessment of prior densities	647
(i) Smoothing of historical data; (ii) Judgemental curve fitting	
15.3.3. An illustration of Bayes' theorem for a single unknown parameter	652
15.3.4. An illustration of Bayes' theorem for two unknown parameters	655
15.3.5. Approximate analysis under great prior uncertainty	657
15.4. <i>Bayesian approaches to typical statistical questions</i>	665
15.4.1. Point estimation	665
15.4.2. Interval estimation	666
15.4.3. Significance testing	668
15.4.4. Prediction	669
15.4.5. Summarizing data: sufficient statistics	669
15.4.6. The likelihood principle	670
15.5. <i>Bayesian inference for some univariate probability models</i>	672
15.5.1. Inferences for Binomial and related distributions	672
15.5.2. Inferences for the Poisson distribution	678

15.5.3. Inferences for the Normal distribution	681
15.6. <i>Bayes' methods when models contain many parameters</i>	685
15.6.1. Inappropriateness of 'completely vague' prior specifications	685
15.6.2. Simple examples	685
15.7. <i>Further reading and references</i>	687
16. MULTIVARIATE ANALYSIS: CLASSICAL METHODS	689
<i>P.N. Jones, University of Keele, Staffordshire, U.K.</i>	
16.1. <i>Introduction</i>	689
16.2. <i>Samples from multivariate Normal (MVN) distributions</i>	695
16.2.1. Maximum likelihood estimation	696
16.2.2. Some sampling distributions	698
16.2.3. Tests and confidence regions for the expectation vector	700
16.2.4. Two-sample problems	701
16.2.5. Inferences about the correlation coefficient	702
16.2.6. Non-central distributions	704
16.3. <i>Principal components</i>	704
16.3.1. Introduction	704
16.3.2. Population principal components	705
16.3.3. Sample principal components	707
16.3.4. Numerical example	708
16.3.5. Some sampling distributions	710
16.4. <i>Factor analysis</i>	710
16.4.1. Introduction	710
16.4.2. Factor model	711
16.4.3. Some properties	711
16.4.4. Estimation	713
16.4.5. Discussion	714
16.5. <i>Canonical correlation</i>	715
16.5.1. Introduction	715
16.5.2. Population canonical correlations	715
16.5.3. Sample canonical correlations	718
16.5.4. Numerical example	719
16.6. <i>Discriminant analysis</i>	720
16.6.1. Introduction	720
16.6.2. Discrimination in two known populations	720
16.6.3. Discrimination in two multivariate populations	721
16.6.4. Discrimination in several populations	723
16.7. <i>Further reading and references</i>	724
17. MULTIVARIATE ANALYSIS: ORDINATION MULTI-DIMENSIONAL SCALING AND ALLIED TOPICS	727
<i>J. Gower, Rothamsted Experimental Station, Harpenden, Hertfordshire, U.K.</i>	
17.1. <i>Introduction</i>	729
17.2. <i>Principal components analysis</i>	727
17.3. <i>Multiplicative models and the Eckhart-Young theorem</i>	733
17.4. <i>Biplots</i>	735
17.5. <i>Correspondence analysis</i>	739
17.6. <i>Metric scaling: principal coordinates analysis and classical scaling</i>	741
17.7. <i>Metric scaling: other methods</i>	746
17.8. <i>Non-metric multidimensional scaling</i>	751
17.9. <i>Multidimensional unfolding</i>	754
17.10. <i>Orthogonal Procrustes analysis</i>	761

17.11. The general comparison of scalings	764
17.12. Three-way scaling	771
17.13. The analysis of asymmetry	776
17.14. Further reading and references	779
18. TIME SERIES	783
G. Tunnicliffe-Wilson, University of Lancaster, U.K.	
18.1. Introduction	783
18.2. Classical regression models for time series	784
18.2.1. Seasonal effects model	784
18.2.2. Cyclical component model	786
18.3. The periodogram of a time series	790
18.3.1. Harmonic components of periodic time series	790
18.3.2. Harmonic regression analysis	792
18.3.3. The periodogram	793
18.3.4. Effect of mean correction on the periodogram	794
18.3.5. Periodograms for simple models	795
18.3.6. The interpretation of periodograms	797
18.4. Differencing operations	798
18.5. Stationary time series	800
18.5.1. The autocorrelation function (acf)	800
18.5.2. The relationship between the periodogram and the acf	803
18.5.3. The spectrum and sample spectrum	804
18.5.4. Properties of the spectrum and acf	805
18.5.5. The partial autocorrelation function (pacf)	806
18.5.6. The sample pacf	808
18.6. The general linear model (GLM)	811
18.6.1. Definition and properties	811
18.6.2. Linear operations on time series	811
18.6.3. Linear operations and the spectrum	813
18.6.4. Linear operations on a finite sample	815
18.6.5. Constraints on the GLM	816
18.6.6. Prediction using the GLM	818
18.7. The moving average (MA) model	818
18.7.1. Model definition	818
18.7.2. Characteristic property of the MA(q) model	819
18.7.3. Efficient estimation for MA(q) models	820
18.7.4. Forecasting using MA models	824
18.7.5. The EWMA predictor	826
18.7.6. Box-Jenkins seasonal model for the airline series	827
18.8. The autoregressive (AR) model	829
18.8.1. Model definition	829
18.8.2. First and second order examples	830
18.8.3. Characteristic properties of the AR(p) model	831
18.8.4. Efficient estimation for the AR(p) model	832
18.8.5. Forecasting using AR(p) models	834
18.9. Autoregressive moving average (ARMA) models	835
18.9.1. Model definition and properties	835
18.9.2. An example	836
18.10. Spectrum estimation	837
18.10.1. The difficulties	837
18.10.2. Direct methods of estimation	837
18.10.3. Indirect methods of estimation	840

18.10.4. The use of spectral analysis	841
18.11. <i>Time series regression models</i>	842
18.12. <i>Further reading and references</i>	845
19. DECISION THEORY	847
A.F.M. Smith, <i>University of Nottingham, U.K.</i>	
19.1. <i>Basic ideas</i>	847
19.1.1. Mathematical framework	847
19.1.2. Minimax and Bayes decision rules	849
19.1.3. Admissible decisions	856
19.1.4. Geometric interpretation	857
19.1.5. Some basic theorems	863
19.2. <i>Statistics and decision theory</i>	868
19.2.1. Estimation	868
19.2.2. Tests of simple hypotheses versus simple hypotheses	870
19.2.3. The Neyman-Pearson lemma	871
19.3. <i>Risk attitudes and utility theory</i>	873
19.3.1. Risk aversion	873
19.3.2. One-dimensional utility functions	879
19.3.3. Assessment of utility functions	882
19.3.4. Higher-dimensional utility functions	883
19.4. <i>Sequential decisions</i>	884
19.4.1. Basic ideas	884
19.4.2. Decision trees	886
19.5. <i>Axiomatic approaches</i>	891
19.5.1. Coherence axioms for decision-making	891
19.5.2. Degrees of belief as probabilities	892
19.6. <i>Further reading and references</i>	896
20. KALMAN FILTERING	897
E. O'Connell and D. Cooper, <i>Institute of Hydrology, Wallingford, U.K.</i>	
20.1. <i>Historical background</i>	897
20.2. <i>State-space models</i>	899
20.2.1. System and measurement equations	899
20.2.2. A simple example	900
20.3. <i>Derivation of the Kalman filter for a discrete linear dynamic system</i>	902
20.3.1. Assumptions	902
20.3.2. The Kalman gain	902
20.3.3. Optimum choice of the Kalman gain	904
20.3.4. State prediction	905
20.3.5. Interpretation of filter equations	905
20.3.6. Summary	906
20.4. <i>Test of filter performance</i>	907
20.4.1. Innovation properties	907
20.4.2. Filter divergence	908
20.5. <i>Kalman filtering for continuous time and non-linear systems</i>	909
20.5.1. Continuous time systems	909
20.5.2. Non-linear systems: the extended Kalman filter	910
20.6. <i>Model identification and parameter estimation</i>	912
20.6.1. General	912
20.6.2. Model identification	915
20.6.3. Parameter estimation	919
(a) Linear estimation; (b) Non-linear estimation	
20.7. <i>Applications</i>	922

20.7.1. An application of the discrete Linear Kalman filter (a) Introduction; (b) identification and parameter estimation; (c) Results	922
20.7.2. An application of the extended Kalman filter (a) The hydrological model; (b) State-space formulation; (c) parameter estimation; (d) Results	929
20.8. <i>Concluding remarks</i>	936
20.9. <i>Further reading and references</i>	936
BIBLIOGRAPHY	939
APPENDIX	A1
INDEX	xxi

SUPPLEMENT

INTRODUCTION	xiii
INTRODUCTION TO THE SUPPLEMENT	xix
1. FURTHER NUMBER THEORY	1
W. Ledermann, University of Sussex, U.K.	
1.1. <i>Introduction</i>	1
1.2. <i>Base of notation</i>	1
1.2.1. The representation theorem	1
1.3. <i>Divisibility</i>	3
1.3.1. The highest common factor (greatest common divisor)	3
1.3.2. Coprime integers	5
1.4. <i>Modular arithmetic</i>	7
1.4.1. Complete residue systems	7
1.4.2. Reduced residue systems	11
1.4.3. Quadratic residues	15
1.5. <i>Finite fields</i>	18
1.5.1. The fields $GF(p)$	18
1.5.2. The fields $GF(p^n)$	20
1.5.3. Vector spaces over $GF(q)$	27
1.5.4. Polynomials over $GF(q)$	27
2. FIBONACCI AND LUCAS NUMBERS	31
S. Vajda, University of Sussex, U.K.	
2.1. <i>Definitions</i>	31
2.2. <i>Examples</i>	33
2.3. <i>Relationships</i>	36
2.4. <i>Diophantine equations</i>	39
2.5. <i>Convergents</i>	40
2.6. <i>Fibonacci series</i>	42
2.7. <i>Divisibility</i>	44
2.8. <i>Prime factors</i>	45
2.9. <i>Residue periods</i>	48
3. CRYPTOGRAPHY AND CRYPTANALYSIS	53
I.C. Piper, Royal Holloway and Bedford New College, Egham, U.K. and C.J. Mitchell, Hewlett-Packard Laboratories, Bristol, U.K.	
3.1. <i>Introduction</i>	53
3.2. <i>The Shannon approach</i>	57

3.2.1.	Definition of a cipher system	57
3.2.2.	Secrecy	58
3.2.3.	Pure ciphers	59
3.2.4.	Perfect secrecy	60
3.2.5.	Cryptanalysis	62
3.2.6.	Entropy and equivocation	63
3.2.7.	Random ciphers	64
3.2.8.	Comment	66
3.3.	<i>Stream ciphers</i>	66
3.3.1.	Stream ciphers and the one-time-pad	67
3.3.2.	Shift registers	68
3.3.3.	Pseudo-randomness	71
3.3.4.	Linear complexity profiles	73
3.3.5.	Cryptographically strong pseudo-random bit generators	74
3.4.	<i>Conventional block ciphers</i>	75
3.4.1.	Feistel ciphers	76
3.4.2.	Cryptanalysis	77
3.5.	<i>Public key systems</i>	79
3.5.1.	One-way functions	80
3.5.2.	Some public key systems	81
3.5.3.	The Diffie-Hellman key exchange	84
3.5.4.	Related mathematical problems	84
3.6.	<i>Personal identification and signatures</i>	85
3.6.1.	Signature schemes	85
3.6.2.	Identification	86
3.7.	<i>Other mathematical themes</i>	89
3.7.1.	Extensions to the Shannon approach	89
3.7.2.	Threshold schemes and key distribution patterns	89
3.7.3.	Zero-knowledge proofs	89
4.	CATALAN NUMBERS AND THEIR VARIOUS USES	93
P. Hilton,	<i>State University of New York, U.S.A. and</i>	
J. Pedersen,	<i>University of Santa Clara, California, U.S.A.</i>	
4.0.	<i>Introduction</i>	93
4.1.	<i>Catalan numbers and the ballot problem</i>	101
4.2.	<i>Generalized Catalan numbers</i>	104
4.3.	<i>Counting p-good paths</i>	110
5.	INTEGRAL EQUATIONS	117
D. Kershaw,	<i>University of Lancaster, U.K.</i>	
5.1.	<i>Introduction</i>	117
5.2.	<i>Fredholm integral equations</i>	120
5.3.	<i>Hermitian kernels, Hilbert-Schmidt theory</i>	129
5.4.	<i>Positive kernels</i>	137
5.5.	<i>Linear Fredholm equations of the first kind</i>	140
5.6.	<i>Volterra integral equations</i>	143
5.7.	<i>Singular kernels</i>	147
5.8.	<i>Difference kernels</i>	153
5.9.	<i>Non-linear equations</i>	159
6.	DYNAMICAL SYSTEMS	165
I. Stewart,	<i>University of Warwick, U.K.</i>	
6.1.	<i>Introduction</i>	165

6.1.1. Ordinary differential equations in the plane	165
6.2. <i>Flows on manifolds</i>	168
6.3. <i>Basic concepts</i>	170
6.3.1. Fixed points	171
6.3.2. Stable and unstable manifolds	172
6.3.3. Stability	174
6.3.4. Discrete and continuous dynamics	175
6.3.5. Liapunov functions	176
6.3.6. Periodic orbits	177
6.3.7. Asymptotic behaviour	178
6.3.8. Flows in the plane	180
6.3.9. Index theory in the plane	181
6.3.10. Special systems	182
6.3.11. Structural stability	184
6.4. <i>Attractors, bifurcations and chaos</i>	186
6.4.1. Attractors	186
6.4.2. Bifurcations	191
6.4.3. Chaos	197
7. CONTROL THEORY	203
D.J. Bell, University of Manchester Institute of Science and Technology, U.K.	
7.1. <i>Introduction</i>	203
7.2. <i>Linear systems</i>	204
7.2.1. Equivalent systems	204
7.2.2. Controllability	205
7.2.3. Observability	207
7.2.4. Controllable and unobservable subspaces	208
7.2.5. Module formulation	209
7.3. <i>Non-linear systems</i>	211
7.3.1. Linear-analytic systems	211
7.3.2. Accessibility	212
7.4. <i>Optimal control</i>	214
7.4.1. Pontryagin's minimum principle	214
7.4.2. Singular control	218
7.4.3. Junction conditions	220
7.4.4. Dynamic programming	221
8. THE FINITE ELEMENT METHOD	227
A.W. Craig, University of Durham, U.K.	
8.1. <i>Introduction</i>	227
8.2. <i>First example</i>	228
8.3. <i>Steady-state (elliptic) problems</i>	230
8.4. <i>Finite element basis functions</i>	233
8.5. <i>The assembly of the finite element system</i>	240
8.6. <i>Accuracy of the finite element approximation</i>	248
8.7. <i>Time-dependent problems</i>	251
9. COMPUTATIONAL COMPLEXITY	255
L. Kronsjo, University of Birmingham, U.K.	
9.1. <i>Introduction</i>	255
9.1.1. Definition of an algorithm	256
9.1.2. Measures of complexity	257
9.2. <i>Arithmetic complexity of computations</i>	258

9.2.1. Matrix multiplication	258
9.2.2. Matrix product by Strassen's algorithm	259
9.2.3. Lower bounds on matrix multiplication	261
9.2.4. The fast Fourier transform (FFT)	263
9.2.5. Product of two integers	265
9.2.6. Worst-case and average-case analysis	266
9.3. Complexity of data processing problems	267
9.3.1. Search problem	267
9.3.2. A binary search algorithm	268
9.3.3. Comparison sort problem	271
9.4. Complexity of combinatorial problems	273
9.4.1. Polynomial and exponential time algorithms	273
9.4.2. Efficient algorithm design techniques	275
9.4.3. Graph searching	280
9.5. Theorem proving by machine	283
9.5.1. The first-order integer addition problem	284
9.5.2. Decidable and undecidable problems	285
9.5.3. Algorithms for decidable problems	285
9.6. Computational complexity and class NP	286
9.6.1. Non-deterministic algorithms	287
9.6.2. The NP-space	288
9.6.3. Relationship between P and NP spaces	288
9.6.4. NP-complete problems	289
9.6.5. Open problems	289
9.6.6. Beyond the NP-class	290

10. NON-COOPERATIVE FINITE GAMES 293

C. Alexander, University of Sussex, U.K.

10.1. Introduction	293
10.2. Elementary theory of non-cooperative finite games	295
10.2.1. Finite games in extensive form	295
10.2.2. Normal form of two-person finite games	299
10.2.3. Subgame-perfect equilibria	305
10.3. Games with incomplete information	306
10.3.1. Bayesian equilibria	306
10.3.2. Sequential equilibria	309
10.3.3. Trembling hand perfect equilibria	313
10.4. Repeated games with complete information	315
10.4.1. Finite repeated games	315
10.4.2. Infinitely repeated games without discounting	318
10.4.3. Infinitely repeated games with discounting	320
10.5. Repeated games with incomplete information	321
10.5.1. The two-person zero-sum case	321
10.5.2. The non-zero-sum case	325
10.6. Evolutionary games	327
10.6.1. Symmetric conflicts	328
10.6.2. Asymmetric conflicts	331
10.6.3. The evolution of cooperation and refinements of the ESS concept	335
10.7. Bargaining theory	336
10.7.1. The axiomatic approach	337
10.7.2. The strategic approach	340
10.7.3. Bargaining with incomplete information	343
10.8. Rational play in non-cooperative games	344
10.8.1. Rationalizable strategic behaviour and Bayesian rationality	345

10.8.2. Refinements of the Nash equilibrium concept	348
10.8.3. Bounded rationality	354
11. POPULATION STRUCTURES	363
S. Vajda, University of Sussex, U.K.	
11.1. Cohorts	363
11.2. Constant populations	364
11.3. The stationary population	365
11.4. Eigenvalues and eigenvectors	368
11.5. General transition matrices	369
11.6. The stable population	373
11.7. The semi-stationary population	375
11.8. Ageing and promotion	378
11.9. Continuous time	379
11.10. States in continuous time	380
12. QUEUEING AND RELATED THEORY	385
B. Conolly, Queen Mary College, London, U.K.	
12.1. Introduction	385
12.2. Definitions	386
12.3. Exponential queues	390
12.3.1. M/M/1/∞	390
(a) System state	390
(b) System time (first come, first served)	394
12.3.2. M/M/2/∞	395
12.3.2. M/M/L/L	396
12.3.3. M/M/∞	397
12.4. Other demand and service mechanisms	397
12.4.1. Generalized exponential systems	397
12.4.2. M/G/1	398
12.4.3. G/M/1	400
12.5. Some special topics	401
12.5.1. Machine maintenance: a closed population	401
12.5.2. Batch queues	401
12.5.3. Networks	402
12.5.4. Heavy traffic analysis	403
12.5.5. Priority disciplines	404
12.6. Concluding remarks	405
13. BOOTSTRAP METHODS	409
A.C. Davison, Imperial College of Science and Technology, London, U.K.	
13.1. Introduction	409
13.2. An example	409
13.3. Why the bootstrap works	413
13.3.1. Generalities	413
13.3.2. Estimation of F	414
13.4. More complex examples	415
13.4.1. Two-sample problem	415
13.4.2. Linear regression	416
13.4.3. Dosage-mortality relationship	418
13.4.4. Autoregressive time series	420
13.5. Efficient bootstrap methods	421
13.5.1. Von Mises expansions	421

13.5.2. Bias estimation	424
13.5.3. Variance estimation	425
13.5.4. An example	426
13.6. Bootstrap significance tests	427
13.7. Confidence intervals	433
13.8. Bibliographic notes	434
14. EXTREME VALUE THEORY	437
R. Smith, University of Surrey, U.K.	
14.1. Introduction	437
14.2. The extreme value distributions	438
14.3. Derivation of the extreme value limit	439
14.4. Exceedances: the generalized Pareto distribution	443
14.5. Statistical methods: introduction	444
14.6. Estimation by maximum likelihood	448
14.7. Maximum likelihood in more complicated situations	453
14.8. The r -largest order statistics method	457
14.9. Threshold methods	459
14.10. Multivariate extremes	463
14.11. Miscellaneous statistical applications	468
INDEX	473
