Editorial Note	xiii
Preface	xv
Contributors to the Guidebook	xix
Introduction: Mathematics for Medicine	1
1 Medical Statistics: Basic Concepts and Methods	9
1.1 Introduction	9
1.1.1 Variation in biology and medicine	10
1.1.2 The idea of a variable	11
1.1.3 Descriptive statistics (1): central tendency or location	12
1.1.4 Descriptive statistics (2): scatter	13
1.2 Distributions in theory and practice	15
1.2.1 Distributions, populations and samples	15
1.2.2 Discrete distributions, independence	16
1.2.3 Distribution of a continuous variable	18
1.2.4 The Normal distribution	20
1.2.5 The χ^2 , t and F distributions	21
1.2.6 Random and non-random samples, randomization	22
1.2.7 Robustness and ‘Normality’	23
1.2.8 Likelihood and sufficiency	25
1.2.9 Transformations	26
1.3 Introduction to statistical inference	27
1.3.1 Estimation (point estimation)	28
1.3.2 Hypothesis testing	30
1.3.3 Type I and type II errors, power	32
1.3.4 Interpretation of statistical significance	34
1.3.5 One-sample t test, degrees of freedom	34
1.3.6 Two-sample t test	36
1.3.7 Paired t test	38
1.3.8 Simple non-parametric methods	38
1.3.9 The chi-squared test on observed counts	40
1.3.10 Chi-squared on ‘contingency tables’	41
1.3.11 Confidence limits (interval estimation)	43
1.3.12 Analysis of proportions	45

1.3.13	Simple linear regression	47
1.3.14	Residuals	50
1.3.15	Correlation	52
1.3.16	Different approaches to statistical inference	53
1.4	Design of medical investigations	55
1.4.1	Asking the right questions	56
1.4.2	The use of controls	57
1.4.3	Deciding sample size for <i>t</i> tests and other tests	59
1.4.4	Crossover trials	61
1.4.5	Sequential methods	63
	Summary of formulae	64
2	Medical Statistics: Advanced Techniques and Computation	69
2.1	Building statistical models in more complex situations.	69
2.1.1	Analysis of variance (ANOVA)	69
2.1.2	Two-way ANOVA and other options.	73
2.1.3	Interpretation of ANOVA for more complicated designs	76
2.1.4	Dangers of non-orthogonal ANOVA, missing values	79
2.1.5	Multiple linear regression	81
2.1.6	Analysis of covariance (ANCOVA)	86
2.1.7	Further analysis of proportions and rates	88
2.1.8	Further details on categorical data	91
2.2	Multivariate analysis	94
2.2.1	Introduction to multivariate analysis	94
2.2.2	Principal components analysis	95
2.2.3	Discriminant analysis	98
2.2.4	Other multivariate techniques	99
2.3	Survival analysis	101
2.4	Computation	103
2.4.1	Statistical calculation	104
2.4.2	Computer programs.	105
2.4.3	Uses and abuses of computers	108
	References	110
3	Formal Approaches to the Analysis of Clinical Decisions	119
3.1	Introduction	119
3.1.1	A place for mathematics	119
3.1.2	The clinical decision problem	120
3.1.3	Diagnosis	122
3.1.4	Further introductory reading	124
3.2	Decision theory	124
3.2.1	A prescription for clinical decision-making	124

3.2.2	Some illustrative examples	129
3.2.3	Assessment of utility	134
3.3	Mathematical methods for diagnosis	136
3.3.1	Principles of discriminant analysis	136
3.3.2	Predictive procedures	141
3.3.3	Bayes' independence model	143
3.3.4	Other methods for modelling feature likelihoods	146
3.3.5	Logistic discrimination	148
3.3.6	Use of artificial intelligence	149
3.4	Other related topics	150
3.4.1	Developing a diagnostic rule	150
3.4.2	Measuring observer error	152
3.4.3	Measuring the performance of diagnostic systems	154
	References	156
4	Statistical Methods in Human Genetics and Immunology	161
4.1	Introduction to population genetics	161
4.2	The Hardy–Weinberg theorem	162
4.2.1	Application of the Hardy–Weinberg theorem: estimates of gene frequency	163
4.2.2	Detecting departures from Hardy–Weinberg equilibrium	166
4.2.3	Some effects of inbreeding on the genotypic distribution	169
4.2.4	Some effects of selection and mutation on the genotypic distribution	171
4.3	Comparisons of populations: genetic distance, relative risk and linkage disequilibrium	176
4.3.1	The comparison of genotypic distributions in samples	177
4.3.2	Measures of genetic distance	179
4.3.3	Testing for linkage disequilibrium and the estimation of relevant parameters	184
4.3.4	Studies of the distribution of genetic markers in individuals with diseases	189
4.4	Introduction to genetic studies of human disorders	193
4.5	Estimation of parameters and testing of some simple genetic hypotheses	194
4.5.1	Estimating the probability of ascertainment	194
4.5.2	Testing the hypothesis of a single gene with full penetrance using information about the immediate families of affected individuals	196
4.5.3	Estimation of parameters assuming polygenic transmission	200

4.6	Testing more complex genetic hypotheses	205
4.6.1	Methods for testing a more general major gene hypothesis for qualitative traits	205
4.6.2	Methods for testing a major gene hypothesis for quantitative traits	207
4.6.3	Linkage studies	209
A short glossary of terms		214
References		216
5	Biological Signal Processing	225
5.1	Introduction	225
5.2	Event and boundary detection	229
5.2.1	Bayes' theorem for a two-class detector	230
5.2.2	Detection of small <i>P</i> -waves	232
5.2.3	Onsets and end-points of waves	235
5.2.4	Dichrotic notches in arterial pressure waves	238
5.3	Patterns from signals	240
5.3.1	Frequency spectrum	240
5.3.2	Covariance matrix	241
5.3.3	Typification	241
5.3.4	Practical implementation	241
5.4	Data reduction and segmentation	243
5.4.1	Segmentation of the electrocardiogram	243
5.4.2	Segmentation for reduction of foetal heart rate patterns	244
5.4.3	Segmentation of electroencephalograms	244
5.5	Systems for signal processing	245
5.5.1	Function laboratories	246
5.5.2	Computer-assisted intensive care	251
5.6	Concluding remarks	254
Appendix 5.A	A summary of mathematical definitions and techniques encountered in signal processing	255
5.A.1	Statistical moments	255
5.A.2	Signals and noise	256
5.A.3	Transformations	267
References		270
6	Mathematical Aspects of Laboratory Medicine	273
6.1	Introduction	273
6.1.1	The role of the clinical laboratory	273
6.1.2	The place of mathematics in the clinical laboratory	274
6.2	Definitions	274
6.2.1	Precision, bias and accuracy	275

6.2.2	Error	275
6.2.3	Assay and assay run	275
6.2.4	Quality control	275
6.2.5	Normal and reference ranges	276
6.3	Laboratory logistics	276
6.4	Variation in biological samples	278
6.4.1	Sampling and the combination of errors	278
6.4.2	Biological rhythms	279
6.4.3	Dynamic tests	280
6.5	Analytical techniques and result derivation	283
6.5.1	The standard curve	283
6.5.2	Linear standard curves	284
6.5.3	Non-linear standard curves	284
6.5.4	Analysis of bio-assay data	285
6.5.5	Validity of curve-fitting	286
6.5.6	Uncertainty of position of the standard curve	288
6.5.7	Assay bias	288
6.5.8	Inherent variation	289
6.5.9	Imprecision and replicate analysis	290
6.5.10	Drift	291
6.5.11	Comparison of analytical methods	293
6.6	Result assessment and quality control	294
6.6.1	Internal quality control techniques	295
6.6.2	External quality assessment techniques	300
References	302
7	Mathematical Aspects of Pharmacokinetics and Protein-Ligand Binding	307
7.1.	Introduction	307
7.2	Compartmental analysis	308
7.2.1	Introduction	308
7.2.2	Rapid intravenous injection in a two-compartment open model	309
7.2.3	First-order absorption in a two-compartment open model	314
7.2.4	A general input and output model	317
7.2.5	Multiple dosing	320
7.2.6	Non-linear systems	321
7.3	Evaluation of pharmacokinetic parameters	323
7.3.1	Graphical technique	323
7.3.2	Numerical technique	324
7.3.3	Examination of the fitted model	325
7.4	Simulation pharmacokinetics	327

7.5	Availability and clearance	328
7.6	Introduction to ligand binding	330
7.7	Mathematical models	331
7.7.1	The stoichiometric model	332
7.7.2	The site-binding model	333
7.7.3	Applicability of the models	334
7.8	Analysis of binding data	337
7.8.1	Graphical techniques	337
7.8.2	Numerical techniques	343
7.8.3	A strategem for the analysis of binding data	346
7.9	Interpretation of binding coefficients	347
7.9.1	The affinity profile	347
7.9.2	Drug distribution	348
7.10	A worked example of drug–protein binding	349
7.11	Further applications	354
	References	356
8	Tracer Techniques and Nuclear Medicine	361
8.1	Introduction	361
8.2	Radioactive decay	362
8.2.1	Exponential decay	362
8.2.2	Parent–daughter relationship	362
8.2.3	Example—The 99m Tc generator	363
8.3	Radioactive sample counting	364
8.3.1	Counting statistics	364
8.3.2	Combination of counting measurements	364
8.3.3	Dual isotope counting	365
8.3.4	Example—dual isotope vitamin B12 absorption test	367
8.4	Curve processing	369
8.4.1	Radioactive decay correction	369
8.4.2	Background corrections	370
8.4.3	Linear least squares fit	370
8.4.4	Least squares fit to an exponential curve	373
8.4.5	Exponential stripping	374
8.4.6	Curve-smoothing	375
8.4.7	Deconvolution	377
8.4.8	Principal components analysis	380
8.4.9	Gamma fit	382
8.5	Compartmental analysis	383
8.5.1	Closed single-compartment system	385
8.5.2	Open single-compartment system	385
8.5.3	Example—exchangeable sodium determination	387
8.5.4	Open two-compartment mamillary system	389

8.5.5	Example—Effective renal plasma flow (ERPF) determination	391
8.6	Blood flow	393
8.6.1	Mean transit time	393
8.6.2	Cardiac output	395
8.6.3	Example—blood volume and cardiac output measurement	397
8.6.4	Organ blood flow	399
8.6.5	Regional blood flow	401
References		403
Bibliography		404
9	Control Techniques in Drug Administration	405
9.1	Introduction	405
9.2	Post-operative control of blood pressure	410
9.3	Control of anaesthesia	413
9.3.1	Drug-induced unconsciousness	413
9.3.2	Drug-induced muscle relaxation	416
9.3.3	Post-operative pain relief	417
9.4	Control of blood glucose levels	422
9.5	Concluding remarks	425
Glossary of terms		426
References		428
10	Linear Graphs: An Approach to the Solution of Systems of Linear Equations	431
10.1	Introduction	431
10.2	The Laplace transform	432
10.3	Linear graphs; notation and rules for graph reduction	432
10.4	Solution of a three-compartment model using a linear graph	435
