PART 1. APPROACHES AND FRAMEWORKS 1

1 Introduction 3
1.1 Objectives and approaches 3
1.2 An outline of the argument 5
1.3 The range of statistical and mathematical theory to be used 5

2 Theory in Human Geography 8
2.1 Introduction 8
2.2 The subject matter of human geography 8
2.2.1 Introduction 8
2.2.2 The basic entities 8
2.2.3 Scale, or level of resolution 9
2.2.4 Spatial representation 10
2.2.5 Static analysis of pattern 10
2.2.6 Processes and dynamics 11
2.2.7 Partial versus comprehensive 11
2.3 The development of theory 12

PART 2. STATISTICAL MODELS IN HUMAN GEOGRAPHY 17

3 Geographical Relationships 19
3.1 Methods of approach 19
3.2 Spatial pattern and spatial process 21
3.2.1 Introduction 21
3.2.2 Spatial process 21

3.2.3 Spatial pattern 22
3.2.4 Spatial pattern and spatial process 23
3.3 Spatial structure 23
3.4 The approach adopted 26

4 Entities, Data and Distributions 28
4.1 Algebraic description of geographical entities 28
4.2 Measurement 30
4.3 Distributions 33
4.3.1 Introduction 33
4.3.2 Theoretical distributions 35
4.3.3 Sampling distributions 39
4.4 Hypothesis testing and degrees of belief 42
4.4.1 Basic concepts 42
4.4.2 'Classical' theory 42
4.4.3 Bayesian theory 44
4.5 Applications and assessment 45

5 Models of Geographical Relationships 48
5.1 The general linear model 48
5.1.1 Introduction 48
5.1.2 Trend-surface models 49
5.1.3 Time-series models 49
5.1.4 Spatial-dependence models 51
5.1.5 Fitting and testing the general linear model 52
5.2 Feedback 54
5.3 Simultaneous systems of relationships 55
5.4 Non-linear and non-stationary relationships 59
5.4.1 Introduction 59
5.4.2 Non-linearity 59
5.4.3 Non-stationarity 60
5.4.4 Models of non-linear and non-stationary relationships. 61
5.5 Bifurcation and catastrophic relationships 65
5.5.1 Introduction 65
5.5.2 Global analysis 65
5.5.3 Catastrophe and bifurcation theory 69
5.6 Conclusion 71

6 Relationships in Space 72
6.1 Spatial processes 72
6.2 Points 72
6.2.1 The null hypothesis 73

6.2.2 More complex processes . . . 73
6.2.3 Areas around points. . . . 74
6.2.4 Size relations of points . . . 75
6.3 Lines and networks . . . 77
6.3.1 Elemental graphs. . . . 77
6.3.2 Directed graphs . . . 78
6.3.3 Chromatic graphs . . . 78
6.3.4 Ordered graphs . . . 78
6.3.5 Connected graphs . . . 79
6.3.6 Scaled graphs . . . 79
6.3.7 Interaction matrices. . . . 79
6.4 Measurement and movement . . . 79
6.4.1 Introduction . . . 79
6.4.2 Distance metrics . . . 80
6.4.3 Forms of surface . . . 81
6.4.4 Movement . . . 82
6.5 Surfaces . . . 83
6.5.1 Introduction . . . 83
6.5.2 Theories of surface structure. . . . 84
6.5.3 Inferences about spatial continuity properties. . . . 85
6.5.4 Smoothing of surfaces . . . 87
6.5.5 Interpolation on surfaces . . . 88
6.6 Zones and regions. . . . 89
6.7 Conclusion . . . 93

7 Relationships in Time . . . 94
7.1 Introduction. . . . 94
7.2 Temporal model and systems of relationships . . . 94
7.2.1 Introduction . . . 94
7.2.2 Cascading systems . . . 95
7.2.3 Process–response systems. . . . 95
7.2.4 Control systems . . . 96
7.3 Models of discrete dynamics . . . 99
7.3.1 Introduction . . . 99
7.3.2 Regional econometric models . . . 101
7.3.3 Models of local government taxing and expenditure . 103
7.3.4 Models of inter-area fiscal incidence . . . 105
7.3.5 Markov chains . . . 107
7.3.6 Identification and estimation. . . . 109
7.3.7 Models of changing parameters. . . . 113
7.4 Models of continuous dynamics . . . 116
7.5 Forecasting and planning control . . . 122

7.5.1 Introduction 122
7.5.2 Dynamic models of monitoring and policy 122
7.6 Conclusion 127

8 Relationships in Space and Time 128
8.1 Introduction 128
8.2 Spatio-temporal models 128
8.3 Comparative statics 134
8.4 Spatial dynamics 136
8.4.1 Introduction 136
8.4.2 Models of urban dynamics 136
8.4.3 Spatial diffusion 140
8.4.4 Hägerstrand's diffusion model 141
8.4.5 Diffusion between regional economies 149
8.4.6 Epidemiological diffusion 155
8.5 Spatial forecasting and control 158
8.6 Conclusion 162

PART 3. MATHEMATICAL MODELS IN HUMAN GEOGRAPHY 163

9 The Main Approaches to Geographical Modelling 165
9.1 Introduction 165
9.2 Account-based modelling 166
9.3 Optimization methods 168
9.4 Dynamics 169
9.5 Systems analysis 170
9.6 The approach in the rest of Part 3 170

10 Population and Migration 172
10.1 Introduction: alternative perspectives 172
10.2 Elementary models 176
10.2.1 Malthusian exponential growth 176
10.2.2 Logistic growth 176
10.2.3 A note on interacting populations 177
10.2.4 Discrete-time formulations of these equations 178
10.2.5 Discrete time with age sectors: the Leslie model . . . 178
10.2.6 The multi-regional cohort-survival model: the Rogers model 180
10.3 Account-based models 181
10.3.1 Introduction: problems with rates 181
10.3.2 Accounts, and notational developments 182

10.3.3 The principles of the account-based model 182
10.3.4 An account-based life-table model 183
10.4 Continuous-time models 184
10.4.1 Introduction 184
10.4.2 The renewal model: single-region and multi-region cases 184
10.4.3 An alternative formulation 186
10.5 Stable population theory and dynamics 190
10.5.1 Introduction 190
10.5.2 Stable populations in the discrete-time model 190
10.5.3 The continuous-time model 192
10.6 A note on migration and residential mobility 194
10.7 Concluding comments 195

11 The Spatial Economy: Coarse Scales 196
11.1 Introduction 196
11.2 The input–output model 196
11.2.1 The aggregate model 196
11.2.2 The inter-regional input–output model 198
11.2.3 Commodity flow and materials balance; the basis for a general model 199
11.3 Activity analysis and other mathematical programming models 200
11.3.1 Activity analysis 200
11.3.2 Other mathematical programming models 202
11.4 Other models 203
11.4.1 Introduction 203
11.4.2 The economic base model 203
11.4.3 A note on freight flows. 204
11.4.4 A Markov model as an example 204
11.5 Change: dynamic models 205
11.5.1 Macro-economic dynamic models 205
11.5.2 Dynamic input–output models 206
11.5.3 Dynamic inter-regional input–output models 207
11.5.4 The 'RAS' method for updating technical coefficients . 207
11.5.5 Notes on some remaining topics 208
11.6 Concluding comments: complexity and research programme . 208

12 Spatial Interaction 210
12.1 Introduction 210
12.2 Families of models 211
12.2.1 Introduction: the problem and the variables 211
12.2.2 The basic family of models 213
12.2.3 Directions for extensions 218

12.2.4 Disaggregation 220
12.2.5 Hybrids 221
12.2.6 Composites: network integration 222
12.2.7 Hierarchies 223
12.2.8 Multi-stage models 223
12.2.9 Integrating spatial interaction equations with other kinds of models 224
12.3 Model outputs and the range of applications 225
12.3.1 Outputs 225
12.3.2 The range of applications 228
12.3.3 Empirical issues 228
12.4 Alternative models. 231
12.4.1 Introduction 231
12.4.2 Regression models 231
12.4.3 The transportation problem of linear programming. . 232
12.4.4 The intervening opportunities model 233
12.4.5 Other alternatives 235
12.5 Alternative derivations of the basic model 236
12.5.1 Introduction 236
12.5.2 The entropy-maximizing method 237
12.5.3 Random utility theory 243
12.5.4 Mathematical programming frameworks 246
12.5.5 Other model derivations 249
12.6 Concluding comments 249

13 The Location of Population Activities 250
13.1 Introduction 250
13.2 Residential location 251
13.2.1 Introduction 251
13.2.2 Interaction models 252
13.2.3 Economic approaches 257
13.2.4 Integration 264
13.3 Shopping 266
13.3.1 Introduction 266
13.3.2 Spatial interaction approaches 267
13.3.3 Alternative models: geographic and economic. . . . 272
13.4 Other services 273
13.5 Integrative approaches 273
13.5.1 Introduction 273
13.5.2 Micro-simulation 274
13.5.3 Economic approaches 275
13.5.4 Time geography 278

13.5.5 Travel and activity choice 279
13.6 Concluding comments 280

14 Location and the Supply Side: the Spatial Economy at Finer Scales 281
14.1 Introduction 281
14.2 Natural resources 282
14.2.1 Introduction 282
14.2.2 Agricultural land use: the legacy of von Thunen . . . 282
14.2.3 'Point' resource problems: water as an example . . . 288
14.3 Retailing dynamics as a paradigm 289
14.3.1 A dynamic model: mechanisms of change 289
14.3.2 The existence and stability of equilibrium solutions . . 291
14.3.3 Disequilibrium: differential or difference equations and another type of bifurcation 294
14.3.4 Dynamics and a disaggregated model 298
14.4 Housing 300
14.4.1 Spatial structures: housing patterns 300
14.4.2 Dynamics and disequilibrium 302
14.4.3 The dynamic housing model in a planning context . . 302
14.5 Industrial location 303
14.5.1 Introduction: the nature of the problem 303
14.5.2 A sketch of industrial location systems 304
14.5.3 Weberian models 305
14.5.4 Other economic approaches 307
14.5.5 Mathematical programming approaches 308
14.5.6 Spatial interaction models 311
14.5.7 Dynamic models 311
14.5.8 Concluding comments 313
14.6 The location of public facilities 314
14.6.1 Introduction: the basic problems 314
14.6.2 A review of approaches 314
14.6.3 Concluding comments 318
14.7 Conclusion 319

15 Comprehensive Models 320
15.1 Introduction 320
15.2 Integrated macro-approaches 321
15.3 Urban structure 1: the Lowry model and its derivatives . . 321
15.3.1 The original model 321
15.3.2 An extended Lowry model 326
15.3.3 Planning applications of Lowry-type models 329
15.3.4 Concluding comments 329

15.4 Urban structure 2: economic approaches 330
15.5 Urban structure 3: central-place theory and spatial interaction–activity models 331
15.5.1 Central-place theory. 331
15.5.2 Spatial interaction–activity models, and the evolution of urban spatial structure 333
15.6 Conclusion 334
