- Preface to the Second Edition *vii*  
Foreword to the First Edition *xi*  
Preface to the First Edition *xiii*  
Figure Acknowledgements *xv*
- 1 Introduction: vision from a biological viewpoint 1**
- 1.1 Input pathways of the mammalian visual system 2
  - 1.2 The evolution of vision in vertebrates 5
    - 1.2.1 The functions of vision 5
    - 1.2.2 Visuomotor modules in non-mammalian vertebrates 7
  - 1.3 Mammalian vision 12
    - 1.3.1 Traditional approaches 12
    - 1.3.2 Visuomotor modules in mammals 14
    - 1.3.3 ‘Two visual systems’ hypotheses 21
- 2 Visual processing in the primate visual cortex 25**
- 2.1 Evidence for parallel processing in retinal ganglion cells 25
    - 2.1.1 ‘On’ and ‘off’ responses 25
    - 2.1.2 X, Y, and W cells 26
  - 2.2 Parallel channels within the primate geniculostriate pathway 27
    - 2.2.1 Magno and parvo channels 27
    - 2.2.2 Magno and parvo projections to the extrastriate cortex 31
  - 2.3 Does magno/parvo map onto dorsal/ventral? 33
    - 2.3.1 The Livingstone and Hubel proposal 33
    - 2.3.2 Contrary evidence 34
    - 2.3.3 Extrageniculate inputs 36
    - 2.3.4 Summary 38
  - 2.4 The organization of the dorsal and ventral streams: a proposed model 39
  - 2.5 Visual processing within the dorsal stream 42
    - 2.5.1 Neuronal activity and visuomotor guidance 42
    - 2.5.2 Coding of space for action 45

- 2.5.3 Coding of visual motion for action 46
- 2.5.4 Coding of object properties for action 51
- 2.5.5 Modularity within the dorsal stream 54
- 2.6 Visual processing within the ventral stream 58
  - 2.6.1 Neuronal coding for visual perception and recognition 58
  - 2.6.2 What is visual perception for? 63
- 2.7 Conclusions: perception versus action 65
- 3 'Cortical blindness' 67**
  - 3.1 Introduction 67
  - 3.2 'Blindsight': action without perception? 68
    - 3.2.1 'Cortical blindness' 68
    - 3.2.2 The pupillary response and GSR 69
    - 3.2.3 Guidance of reaching and grasping 70
    - 3.2.4 Detection and discrimination in blindsight 77
    - 3.2.5 Colour processing in blindsight 81
    - 3.2.6 Motion processing in blindsight 83
  - 3.3 Why is blindsight blind? 85
  - 3.4 Conclusions 86
- 4 Disorders of spatial perception and the visual control of action 87**
  - 4.1 Space: egocentric and allocentric coding 88
  - 4.2 Disorders in the visual control of action: the Bálint–Holmes syndrome 92
    - 4.2.1 Disorders of reaching: 'optic ataxia' or 'disorientation'? 92
    - 4.2.2 Visually guided eye movements 96
    - 4.2.3 Disorders of grasping 96
    - 4.2.4 Evidence from monkeys 102
  - 4.3 Disorders of spatial perception in humans 106
    - 4.3.1 Is 'visual–spatial agnosia' a myth? 106
    - 4.3.2 Higher level representations of space: a confluence of the dorsal and ventral streams? 110
    - 4.3.3 Is the right parietal lobe 'dominant' for space? 112
  - 4.4 'Visuospatial' deficits in the monkey 113
    - 4.4.1 The landmark task 113
    - 4.4.2 Route finding 117
    - 4.4.3 Behavioural deficits caused by posterior parietal lesions 118
  - 4.5 What is the visual function of the parietal lobe? 119

- 5 Disorders of visual recognition 121**
  - 5.1 Types of agnosia 121
  - 5.2 Visual form agnosia 123
    - 5.2.1 Pathology 123
    - 5.2.2 The symptoms of visual form agnosia 125
  - 5.3 Patient D.F.: a case history of visual form agnosia 126
    - 5.3.1 Deficits in visual perception 126
    - 5.3.2 Preserved visuomotor abilities 128
    - 5.3.3 What visual pathways are damaged in D.F.? 134
    - 5.3.4 Limits on D.F.'s visual coding for action 137
    - 5.3.5 Tricks and strategies 143
  - 5.4 'Apperceptive agnosia' and the right hemisphere 145
    - 5.4.1 'Transformation agnosia' 145
    - 5.4.2 'Topographical agnosia' 147
  - 5.5 'Associative agnosia' and the left hemisphere 150
  - 5.6 Agnosia in monkeys? 151
    - 5.6.1 Recognition deficits 151
    - 5.6.2 Spared visuomotor abilities 154
  - 5.7 Summary 155
- 6 Dissociations between perception and action in normal subjects 157**
  - 6.1 Introduction 157
  - 6.2 Different frames of reference for perception and action 157
  - 6.3 Movements to remembered places: a possible role for perception in the control of action? 165
  - 6.4 Illusory size distortions 168
  - 6.5 Grasping remembered objects 171
  - 6.6 Differences between perceptual and visuomotor memory 174
  - 6.7 Perceptual stability and postural adjustment 175
  - 6.8 Distance judgements and the calibration of locomotion 177
  - 6.9 Conclusions 178
- 7 Attention, consciousness, and the coordination of behaviour 181**
  - 7.1 Streams within streams 181
  - 7.2 Attention 182
    - 7.2.1 Attention and consciousness 182
    - 7.2.2 Physiological studies of visual attention 186
  - 7.3 The 'neglect syndrome' 192
    - 7.3.1 Hemispatial neglect 192
    - 7.3.2 Visual extinction 198

7.3.3	Directional hypokinesia	199
7.3.4	Is there a neglect 'syndrome'?	200
7.4	Consciousness and attention	202
7.5	The integrated action of perceptual and visuomotor systems	204
<b>8</b>	<b>Epilogue: twelve years on</b>	<b>207</b>
8.1	New insights into the ventral and dorsal streams	208
8.1.1	The functional organization of the ventral stream	208
8.1.2	The functional organization of the dorsal stream	215
8.1.3	Mirror neurones: an interaction between the two streams	219
8.2	From consciousness to action	221
8.2.1	The roles of the dorsal and ventral streams in visual awareness	221
8.2.2	Knowledge and action	228
8.2.3	The role of attention in integrating the two streams in adaptive behaviour	231
8.3	Operating principles of the dorsal stream: new insights	235
8.3.1	Does the dorsal stream care about non-target objects?	235
8.3.2	The dorsal stream as an 'automatic pilot'	237
8.4	Spatial and temporal constraints on perception and visuomotor control	239
8.4.1	Metrics and frames of reference	239
8.4.2	Action and illusion	240
8.4.3	Reaching into the past	245
8.4.4	Learning new skills	248
8.5	The Future	251
