

Contents

Preface	VII
Dedication	IX
Previous John H. Barrett Lectures (1970–1995)	X
List of Participants	XII

Ronald Fintushel

New Directions in 4-Manifold Theory

Lecture 1: Donaldson and Seiberg-Witten Invariants	1
Lecture 2: The Immersed Thom Conjecture	13
Lecture 3: Intersection Forms of Smooth 4-Manifolds	19
References	27

Sergiu Klainerman

On the Regularity of Classical Field Theories in Minkowski Space-Time \mathbb{R}^{3+1}

Introduction	29
1 Relativistic Field Theories	31
2 The Problem of Break-down	39
3 Energy estimates and the Problem of Optimal Local Well Posedness	49
4 Proof of the Null Estimates	56
5 The Proof of Theorem 4	61
6 Conclusions	67
Bibliography	67

Fang-Hua Lin

Static and Moving Vortices in Ginzburg-Landau Theories

Introduction	71
Lecture 1	
1 Background and Models	72
2 The Work of Bethuel-Brézis-Hélein and Others	76
3 Some Generalizations	83
Lecture 2	
1 Renormalized Energy	87
2 A Technical Result	91
3 Proof of Theorem A	92
4 Proof of Theorem B	95

Lecture 3: The Dynamical Law of Ginzburg-Landau Vortices

1	Gor'kov-Eliashberg's Equation	100
2	Uniqueness of Asymptotic Limit	101
3	Vortex Motion Equations	103
	References	109

Michael Struwe

Wave Maps

1	Local existence. Energy method	113
1.1	The setting	113
1.2	Wave Maps	114
1.3	Examples	115
1.4	Basic questions	115
1.5	Energy estimates	116
1.6	L^2 -theory	116
1.7	Local existence for smooth data	117
1.8	A slight improvement	118
1.9	Global existence, the case $m = 1$	122
2	Blow-up and non-uniqueness	123
2.1	Overview	123
2.2	Regularity in the elliptic and parabolic cases	124
2.3	Regularity in the hyperbolic case	126
3	The conformal case $m = 2$	131
3.1	Overview	131
3.2	The equivariant case	132
3.3	Towards well-posedness for general targets	138
3.4	Approximation solutions	139
3.5	Convergence	143
	References	150
	Index	155
