<b>PART 1</b>	<b>Linear and Nonlinear Processes</b>	<b>1</b>
1	Introduction	3
	What we mean by 'system'	3
	Physicalism: the first attempt to describe social systems using the methods of natural systems	5
2	Modelling	10
	A brief introduction to modelling	10
	Direct problems and inverse problems in modelling	12
	The meaning and the value of models	14
3	The origins of system dynamics: mechanics	19
	The classical interpretation of mechanics	19
	The many-body problem and the limitations of classical mechanics	22
4	Linearity in models	27
5	One of the most basic natural systems: the pendulum	32
	The linear model (Model 1)	32
	The linear model of a pendulum in the presence of friction (Model 2)	35
	Autonomous systems	37
6	Linearity as a first, often insufficient approximation	39
	The linearization of problems	39
	The limitations of linear models	42
7	The nonlinearity of natural processes: the case of the pendulum	46
	The nonlinear pendulum (Model 3 without friction, and Model 3' with friction)	46
	Non-integrability, in general, of nonlinear equations	47
8	Dynamical systems and the phase space	49
	What we mean by dynamical system	49
	The phase space	50
	Oscillatory dynamics represented in the phase space	54

9	Extension of the concepts and models used in physics to economics	60
	Jevons, Pareto and Fisher: from mathematical physics to mathematical economics	60
	Schumpeter and Samuelson: the economic cycle	62
	Dow and Elliott: periodicity in financial markets	64
10	The chaotic pendulum	67
	The need for models of nonlinear oscillations	67
	The case of a nonlinear forced pendulum with friction (Model 4)	68
11	Linear models in social processes: the case of two interacting populations	71
	Introduction	71
	The linear model of two interacting populations	72
	Some qualitative aspects of linear model dynamics	73
	The solutions of the linear model	76
	Complex conjugate roots of the characteristic equation: the values of the two populations fluctuate	84
12	Nonlinear models in social processes: the model of Volterra–Lotka and some of its variants in ecology	93
	Introduction	93
	The basic model	94
	A non-punctiform attractor: the limit cycle	98
	Carrying capacity	101
	Functional response and numerical response of the predator	103
13	Nonlinear models in social processes: the Volterra–Lotka model applied to urban and regional science	108
	Introduction	108
	Model of joint population–income dynamics	108
	The population–income model applied to US cities and to Madrid	113
	The symmetrical competition model and the formation of niches	118

---

## PART 2 From Nonlinearity to Chaos 123

---

14	Introduction	125
15	Dynamical systems and chaos	127
	Some theoretical aspects	127
	Two examples: calculating linear and chaotic dynamics	131

	The deterministic vision and real chaotic systems	135
	The question of the stability of the solar system	137
16	Strange and chaotic attractors	141
	Some preliminary concepts	141
	Two examples: Lorenz and Rössler attractors	146
	A two-dimensional chaotic map: the baker's map	150
17	Chaos in real systems and in mathematical models	154
18	Stability in dynamical systems	159
	The concept of stability	159
	A basic case: the stability of a linear dynamical system	161
	Poincaré and Lyapunov stability criteria	163
	Application of Lyapunov's criterion to Malthus' exponential law of growth	168
	Quantifying a system's instability: the Lyapunov exponents	171
	Exponential growth of the perturbations and the predictability horizon of a model	176
19	The problem of measuring chaos in real systems	179
	Chaotic dynamics and stochastic dynamics	179
	A method to obtain the dimension of attractors	183
	An observation on determinism in economics	186
20	Logistic growth as a population development model	190
	Introduction: modelling the growth of a population	190
	Growth in the presence of limited resources: Verhulst equation	191
	The logistic function	194
21	A nonlinear discrete model: the logistic map	199
	Introduction	199
	The iteration method and the fixed points of a function	201
	The dynamics of the logistic map	204
22	The logistic map: some results of numerical simulations and an application	214
	The Feigenbaum tree	214
	An example of the application of the logistic map to spatial interaction models	224
23	Chaos in systems: the main concepts	231

---

<b>PART 3</b>	<b>Complexity</b>	<b>237</b>
<hr/>		
24	Introduction	239
25	Inadequacy of reductionism	240
	Models as portrayals of reality	240
	Reductionism and linearity	241
	A reflection on the role of mathematics in models	243
	A reflection on mathematics as a tool for modelling	246
	The search for regularities in social science phenomena	249
26	Some aspects of the classical vision of science	253
	Determinism	253
	The principle of sufficient reason	257
	The classical vision in social sciences	259
	Characteristics of systems described by classical science	261
27	From determinism to complexity: self-organization, a new understanding of system dynamics	266
	Introduction	266
	The new conceptions of complexity	268
	Self-organization	271
28	What is complexity?	275
	Adaptive complex systems	275
	Basic aspects of complexity	277
	An observation on complexity in social systems	280
	Some attempts at defining a complex system	281
	The complexity of a system and the observer	285
	The complexity of a system and the relations between its parts	286
29	Complexity and evolution	291
	Introduction	291
	The three ways in which complexity grows according to Brian Arthur	291
	The Tierra evolutionistic model	295
	The appearance of life according to Kauffman	297
30	Complexity in economic processes	301
	Complex economic systems	301
	Synergetics	304
	Two examples of complex models in economics	307
	A model of the complex phenomenology of the financial markets	309

31	Some thoughts on the meaning of 'doing mathematics'	315
	The problem of formalizing complexity	315
	Mathematics as a useful tool to highlight and express recurrences	320
	A reflection on the efficacy of mathematics as a tool to describe the world	323
32	Digression into the main interpretations of the foundations of mathematics	329
	Introduction	329
	Platonism	330
	Formalism and 'les Bourbaki'	331
	Constructivism	336
	Experimental mathematics	340
	The paradigm of the cosmic computer in the vision of experimental mathematics	341
	A comparison between Platonism, formalism, and constructivism in mathematics	343
33	The need for a mathematics of (or for) complexity	348
	The problem of formulating mathematical laws for complexity	348
	The description of complexity linked to a better understanding of the concept of mathematical infinity: some reflections	351
	References	356
	Subject index	375
	Name index	380
