

# TABLE OF CONTENTS.

## CHAPTER I.

The Physical Foundations of Inference, or the World as the Logician regards it: an exposition of the principal assumptions demanded for the establishment of a Material or Objective System of *Logic*. (pp. 1—45)

---

- I. (1) The distinct duality consisting of the phenomena on the one hand, and the observer on the other. (1—4)
- (2) A long antecedent process of synthesis, or the grouping of the mere elements of externality into definite objects. (4—8)
- II. Objective uniformity of the phenomenal world. (9—11)
- III. The world must be postulated as being essentially the same to all observers: (11, 12)
- (1) This involves no insuperable difficulty as regards the present time; (13)
- (2) As regards the remote past and future it involves the difficulty that the conceptions, and therefore in a sense the objects, must correspond to our own realization of them rather than to how they were, or will be, realised by contemporary observers. (14—19)
- IV. Necessity that the logician shall leave the external world entirely undisturbed, if his inferential processes are to be theoretically valid. (19—22)
- V. The fundamental duality postulated in Logic is sometimes disregarded. (22—28)
- (1) By over-objectifying the science. (23—26)
- (2) By under-estimating its external character. (26—28)
- VI. We postulate the distinction between truth and falsehood. (28—38)
- (1) This distinction under its most general aspect. (28—32)
- (i) As applied to terms. (29)
- (ii) As applied to propositions. (30)
- (2) Variety of tests available for this distinction. (32—38)
- (i) That of mere conceivability:—the conceptualist test. (33—35)
- (ii) That of accordance with general experience:—the scientific test. (36)
- (iii) That of appeal to special authority:—the fictional test. (36—38)
- VII. As regards Language, we must assume;
- (1) Identity of signification amongst those who inter-communicate; (38—43)
- (2) License to substitute equivalent terms. (43—45)

## CHAPTER II.

The Foundations of Logic considered more in detail, and especially in respect of what is demanded for Inference; (I) Sequences of Phenomena, or Laws of Causation. (pp. 46—73)

---

Causation as understood by the Aristotelians. (48—52)

Exposition of successive stages in the modern treatment;—

- I. The primitive or popular view of Causation. (53—56)
- II. The popular view as rendered more precise by the logicians;
  - (1) In respect of completer enumeration of antecedents: (56, 57)
  - (2) In respect of closeness of sequence. (57—61)

Consequence of the above rendering: Plurality of Causes. (62—65)
- III. Further refinements of the sequence-account of Causation.
  - (1) Attempt at absolute inclusion of all the antecedents. (65, 66)
  - (2) Insistence on immediateness of sequence. (67)

This refined view admits of two interpretations:—

  - (1) That of the recurrence of cycles in the world's history. (68)
  - (2) That of affording an indication of initial tendencies only. (69)

Both of these interpretations render the Causal relation hypothetical, and inapplicable to concrete events. (70—73)

## CHAPTER III.

Continuation of the previous subject in respect of (II) Co-existences; and comparison of these with Sequences through the same three stages of advancing precision and completeness. (pp. 74—93)

- 
- I. In the primitive or popular stage no distinction as regards validity of inference is commonly recognized between the two kinds of Uniformity. (75)
  - II. In the improved, or popular scientific stage some difference arises, owing to the absence of the differentiating element of Time; but the formula admits of re-statement in a modified shape. (76—79)
  - III. In the final stage, of ultra-refinement, the formula again becomes imperious to attack; but proves to be hypothetical and inapplicable. (79—81)
  - IV. Consideration of the principal existent classes of Co-existence;—
    - (1) Properties of Natural Substances: (82, 83)
    - (2) Properties of Natural kinds: (83—85)
    - (3) Groups of Conventional actions: (85—87)
    - (4) Geometrical properties. (87)
  - V. Are there any Universal Laws of Co-existence? (88)
 

Do the two factors of the Co-existence mutually determine each other? (89)

Further illustration of the significance of Co-existence. (90—93)

## CHAPTER IV.

The Uniformity of Nature; or that wide conception of Regularity in the external world, which is the objective counterpart of Inferribility. (pp. 94—111)

---

Enumeration of the main subdivisions; including those of the last two chapters.

- I. Uniformities of Sequence, divisible into;—
  - (1) Laws of Nature, commonly so-called: (95)
  - (2) Empirical laws. (96)
- II. Uniformities of Co-existence, similarly divisible into those which are
  - (1) strictly interpreted; (96)
  - (2) popularly regarded. (96)

We must also assume the Repetition of Similar Cases, in order to render the above available for use. (97—102)
- III. Uniformities of a Rhythmic character. (102, 103)
- IV. The conservation of Energy. This extends the area of ordinary Causation
  - (1) By embracing continuous changes as opposed to discrete events. (104)
  - (2) By supplying connecting links between different sciences. (104)
  - (3) By leading to quantitative results. (105)
- V. Statistical Uniformities of the kind characteristic of Probability. (106)
- VI. Uniformities of mere Persistence. (107—111)

## CHAPTER V.

The Subjective Foundations of Induction, or the principal postulates demanded on the Mental side. (pp. 112—137)

---

For the purpose of Inductive Inference it is necessary that we should postulate:—

- I. Ordinary powers of Observation:—Difficulty in deciding where to draw the line between Observation and Inference. (112—117)
- II. The Faculty of Memory: which is necessary even for the formation of Terms and of Judgments. (117—120)
- III. The Belief in Uniformity; as distinct from, but correspondent to, the objective Uniformity itself:
  - (1) This distinction is significant, since either element might conceivably exist without the other. (120, 121)
  - (2) It is variously described as involving (i) the step from the past to the future, (ii) from the known to the unknown, (iii) from the observed to the unobserved. (122—125)

Discussion of the so-called Ground of Induction; or the difficulty attending the origin of the belief in Uniformity.

Detailed examination of a physical example, and discussion of the problem as it might be raised (1) in Deduction (2) in Induction. (125—129)

Answers of Whately,—the Scotch school,—Mill,—Hume. (129—132)

The Difficulty psychological rather than logical. (133—137)

## CHAPTER VI.

Language : a discussion of the principal questions involved in its reference, functions, medium, and varieties. (pp. 138—160)

- 
- I. The reference of Language : whether (1) to our conceptions or (2) to the phenomena themselves? (138—142)
- II. The functions of Language :
- (1) The communication of ideas from one person to another. (143)
  - (2) The recording of them for ourselves and others. (143)
  - (3) The acquisition of ideas, by aiding the processes of (i) synthesis and (ii) analysis. (144—146)
- The visual or image-language of the uneducated. (148, 149)
- III. The medium by which Language is conveyed, as viewed in relation to;—
- (1) The sense to which it appeals. (151, 152)
  - (2) The organ or other appliance by which it is produced. (153, 154)
- The main requisites which thence determine the choice of the medium. (154—157)
- IV. The various distinct kinds of language in use : The spoken, and heard :—  
The written, and read :—The fingered, and seen or felt. (157—160)

## CHAPTER VII.

Terms ; as interpreted and subdivided in Logic. (pp. 161—196)

- 
- I. Individual Terms ; where the plurality of the constituent elements is subordinate to their unity ;—
- (1) Proper, or logically 'unmeaning' terms. (162—164)
  - (2) Demonstrative terms. (164, 165)
  - (3) General terms conventionally restricted. (166)
  - (4) Combination of general terms. (167, 168)
  - (5) General terms with time or place limitations. (168)
  - (6) Individua vaga : their functions. (169)
- II. Collective Terms ; where the unity and plurality are nearly equally conspicuous. (170—174)
- III. General Terms ; where the plurality of the constituent elements becomes predominant. These are practically equivalent to Connotative terms.
- (1) Connotation and Denotation inversely variable : (175)
  - (2) Denotation real ; Connotation notional : (176, 177)
  - (3) Connotation theoretically the leading element of the two : (177, 178)
  - (4) The range or extent of the Denotation : (179—182)
  - (5) The attributes comprising the Connotation : are they ;
    - (i) those implied by the name, (183)
    - (ii) all those possessed in common by the objects, (184, 185)
    - (iii) those only from which the rest can be inferred? 'Suggestion' and 'Implication.' (186—188)

- IV. Concrete and Abstract names : these mainly relative. (189)
- (1) The grammatical view. (190)
  - (2) The psychological view. (190, 191)
- V. Positive and Negative Terms. (192)
- (1) Contradictories, (i) material, (ii) formal. (192—194)
  - (2) The logician's plan. (195)
  - (3) Disparate and contrary. (195, 196)

## CHAPTER VIII.

Propositions: their general nature and composition. (pp. 197—218)

---

- I. The Subject and Predicate arrangement : its convenience;—
- (1) Economy of this arrangement : (199, 200)
  - (2) Its aid in the progress of thought. (200)
- II. Gradations of suitability for the Subject and Predicate form of speech;—
- (1) Physical substances and their present attributes : (201)
  - (2) Complex, remote, and contingent attributes : (202—204)
  - (3) 'Mixed modes,' and conventional groups of events : (205)
  - (4) Nature of existential propositions : (206—208)
  - (5) The Subject and Predicate in hypothetical propositions. (208)
- III. General nature of the distinction between Subject and Predicate : which is the prior element? which is the more important? Occasional absence of this distinction. (209—214)
- The Proposition regarded as the answer to a possible question. (214)
- IV. Affirmative and Negative propositions : (215)
1. This distinction as developed in Symbolic Logic. (216)
  2. The distinction real, though often difficult of application. (217, 218)

## CHAPTER IX.

The Schedule of Propositions: the various ways in which they may be arranged and subdivided for logical purposes. (pp. 219—239)

---

- I. The traditional logical, or A . E . I . O scheme :—
- (1) In this arrangement the subject is viewed as denoting a class, and the predicate an attribute. (220—223)
  - (2) Detailed statement of the six resultant forms of assertion and denial : (223—226)
- Reduction of these six to the customary four : significance and use of particular propositions. (226—228)
- II. The Class-inclusion and exclusion scheme, and its resultant five forms of proposition. (229)
- III. The Existential scheme ; in which the logical distinction between subject and predicate is obliterated. (230—232)
- (1) Predication of existence on the part of an object : (233)
  - (2) Impersonal propositions. (234—236)
- IV. Certain other propositions employed in common life and in science :
- (1) Vague quantitative or numerical assertions. (237)
  - (2) Definite assertions of a proportional kind. (239)

## CHAPTER X.

Hypothetical and Disjunctive Judgments; their distinctive characteristics, and the circumstances of their origin. (pp. 240—265)

- 
- Objectively regarded, all events may be called certain; but, expressed in propositions, the element of doubt or uncertainty often prevails.
- I. Single facts may be thus doubtfully held: hence the ancient Modals, better relegated to Probabilities. (241—243)
  - II. There is a form of doubt as to the limits of our assertions which leads to the Disjunctive:
    - (1) In the range of the predicate, as indicated by hesitation between two or more attributes:  $X$  is  $Y$  or  $Z$ . (243—246)
    - (2) In the range of the subject, on similar grounds:  $X$  or  $Y$  is  $Z$  (246, 247)

Discussion of the real import in these cases. (248)
  - III. Two events may be known to be generally connected, but we may be in doubt as to the occurrence of the antecedent: this is the foundation of the Hypothetical form. (248—265)
    - (1) The Hypothetical assumes different symbolic shapes. (252)
      - (i) Sometimes it involves three terms; If  $X$  is  $Y$  it is  $Z$ . (253)
      - (ii) Sometimes four terms; If  $X$  is  $Y$  then  $Z$  is  $W$ . (253)

These are mainly matters of expression, the fundamental form being, If  $P$  then  $Q$ . (254—256)
    - (2) As to the fixity of popular usage,
      - (i) Is the Categorical used in cases properly applicable to the Hypothetical? (257—260)
        - (a) Symbolic Logic regards all subjects of propositions as hypothetical. (260)
        - (b) Popular Logic hesitates, with resultant uncertainty as to conversion. (261)
      - (ii) Is the Hypothetical used in cases properly applicable to the Categorical? (262—264)

## CHAPTER XI.

Definition; in Logic and in Science. (pp. 266—308)

- 
- I. The "Five Words" as now generally interpreted. (267—269)
  - II. Definition in its current and old signification: Meaning of *Essence*. (269—273)
  - III. Definition, Nominal and Real.
    - (1) As interpreted by Hamilton. (273)
    - (2) The customary view. (274)
    - (3) Mill's view. (275, 276)
  - IV. The Limits of Definition.
    - (1) The Scholastic account. (277)
    - (2) The modern popular account. (278)
    - (3) The most convenient view. (278)

- V. Definitions : why needed ?
- (1) For general purposes. (279)
  - (2) For special instruction. Technical definitions. (280, 281)
  - (3) Definitions in Mathematics and Natural Science. (282—285)
  - (4) How definitions come to be modified. (285—288)
- VI. Characteristics of a good Definition.
- Five current rules for securing this. Definition and Description. (288—290)
- VII. Essential and Accidental Propositions.
- (1) Is this distinction applicable to proper names? (292)
  - (2) Can there be accidental predication of imaginary objects? (293—295)
  - (3) Verbal Disputes. (295)
  - (4) Contradiction in terms. (296, 297)
  - (5) The above distinctions applied to certain peculiar cases. (298—300)
- VIII. Modifications of the process of full technical Definition :
- (1) Definition by Genus and Differentia. (301, 302)
  - (2) Descriptions. (303)
  - (3) Definition by type. (304, 305)
  - (4) Genetic Definitions. (306—308)

## CHAPTER XII.

Division, in its old interpretation : the simple analysis of the Denotation of terms. (pp. 309—317)

- I. Whereas (1) Definition is formal and direct ; (2) Division is by comparison material and indirect. (309, 310)
- II. The old account of Division ; (311)
  - (1) The Porphyrian Tree : The Category. (312—314)
  - (2) Bifurcate Division. (314)
- III. The rules for Division. (315—317)

## CHAPTER XIII.

Division scientifically considered : further analysis and development. (pp. 318—343)

- I. Such Analysis leads in two opposite directions :—
  - (1) To a formal development, by continual Dichotomy. *Symbolic Logic*. (318—321)
  - (2) To a material development by study of Nature. Classification. (321—323)
- II. Classification for special purposes ; e.g.
  - (1) The Analytical Key. (324—327)
  - (2) The Alphabetical Arrangement. (327, 328)
- III. Classification for general purposes. (329—332)
- IV. 'Natural' Classification.
  - (1) Proposal to group the objects so as to secure a maximum of common assertion. (332)
  - (2) Classes founded on Natural Kinds. (333)
    - (i) The Natural System as understood till recently. (334—338)
    - (ii) As influenced by Theory of Evolution. (338—341)

Characteristics:—Increase of historic interest : interpretation of Affinity : relative importance of attributes.
- V. Natural Classification as applied to Artificial objects. (341—343)

## CHAPTER XIV.

Induction ; or the process of generalizing an attribute, observed in certain objects, over the whole class to which they belong. (pp. 344—373)

- I. When the whole process of an original Induction is examined, we find that it involves many preliminary difficulties besides the step of mere generalization ; (345) for,
  - (1) The class of objects being familiar, the observed attribute may be new ; (347)
  - (2) Or, the attribute being familiar, the class may be new ; (348)
  - (3) Or the range of generalization too wide to be familiar. (349)
 That is, some insight must be pre-supposed besides the step of mere generalization.
- II. Also some additional security or proof (351). Hence, generally, three stages are observable ;
  - (1) A stroke of creative genius ; (352)
  - (2) A more formal process of Generalization, involving Analysis and Exclusions ; (352)
  - (3) A process of Verification of some kind. (353)
- III. Fuller discussion of the part assigned to each stage by various logicians. (354—363)
  - (1) Whewell emphasizes the creative part. (354—357)
  - (2) Mill, the inferential part. (357, 358)
  - (3) Jevons the verificatory part : Inverse processes. (359—363)
- IV. Certain other accounts of the process ;—
  - (1) Induction and Deduction as 'ascending' and 'descending' ; (364)
  - (2) As proceeding from Effects to Causes, and conversely ; (364)
  - (3) As proceeding from Facts to Ideas, and conversely ; (365, 366)
  - (4) As corresponding to Analysis and Synthesis. (367—373)

## CHAPTER XV.

The Syllogism in relation to Induction : modified acceptance of Mill's view. (pp. 374—382)

- Summary statement of this view. (374)
- The main grounds for its acceptance seem to be ;—
- (1) The empirical theory as to the origin of our knowledge ; (376)
  - (2) The objective treatment of the science of Logic ; (376)
  - (3) The supposed impossibility of realizing the premisses without realizing the conclusion. (377)
- Discussion of these various considerations, and modified acceptance of the doctrine in question. (377—382)

## CHAPTER XVI.

Analysis and Synthesis, regarded as correlated applications of the general process of Hypothesis. (pp. 383—402)

- I. In certain cases (e.g. Chemistry) Analysis and Synthesis are actual manipulative processes ; but generally they are processes of the Understanding which require us to 'suppose' separations and combinations which do not, or may not, exist. (383—385)

- II. Hence we must determine the uses and limits of this process; (385—392)
- (1) The *Constructive* use: i.e. in forecasting the future, or in attempting to interpret the past and present. (389, 390)
  - (2) The *Illustrative* use: i.e. in familiarizing ourselves with the action of physical and other laws. (391, 392)
- III. These must be subject to the following restrictions;—
- (1) Definite limits to the conceived change; (392—395)
  - (2) The events in question must not be unique. (395—398)
- Summary account of the above exposition: its bearing on Analysis and Synthesis, and on the claim to frame Hypotheses. (398—402)

## CHAPTER XVII.

Inductive Methods: the analysis of the Antecedents, and exclusion of all but the Cause. (pp. 403—435)

- I. Selection of a really suitable artificial example: four antecedents; four possible cases resultant. (404—408)
- II. Characteristics displayed by above example.
  - (1) Antecedents definite in their nature. (409)
  - (2) Any combination of them admissible. (410)
  - (3) Their possible divisions assignable. (410)
  - (4) Considerable extraneous knowledge assumed. (410)
  - (5) Causal conditions taken for granted. (410)

Now contrast, in these respects, a real example from nature. (411)
- III. The physical conditions of Nature practically force us to one or other of the following methods; (416)
  - (1) Method of Difference: involving as conditions:
    - (i) That there be no time for external interference. (418, 419)
    - (ii) That we do not ourselves interfere. (420)
  - (2) Modification of above method: 'Concomitant Variations.' (421—424)
  - (3) Method of Agreement. (425—429)
  - (4) Joint Method of Agreement and Difference, or Method of Exclusion. (430—434)

Summary of results. (435)

## CHAPTER XVIII.

Standards and Units, as applicable to physical objects or events. (pp. 436—456)

- I. Quantitative results are necessary for Science. These demand Standards and Units: distinction between these. (437—443)
  - (1) Things are measured by a Unit 'of their own kind'; (439)
  - (2) Which unit we have to 'apply' to the thing measured. (440—442)
- II. General assumption as to the Uniformity of Nature demanded in all reliance upon units.
  - (1) Practical application to our wants. (443)
  - (2) Extra-practical. (444)
  - (3) Purely theoretical. (445)
- III. Our Units are arbitrary in their character. (447)
 

Distinction between fundamental and derived units. (448—450)

## IV. Principal kinds of Units employed in Science:—

- (1) Of Length; (450)
- (2) Of Mass; (451)
- (3) Of Time. (452—456)

## CHAPTER XIX.

Standards and Units as applied directly to Psychological data. (pp. 457—473)

## I. Psychological data claim measurement for two reasons:—

- (1) Ultimate resort to them, in the shape of a direct estimate, can never be avoided. (457—460)
- (2) Physical Science is ever tending to diminish the importance of the mere sensation as compared with the property underlying it; hence the former are left over for separate consideration. (460—463)

## II. Illustration of psychological units and standards by the example of tooth-ache. (463—465)

Two difficulties encountered here;—

- (1) That of obtaining the two 'ends' demanded in measurement. (466)
- (2) That of compounding sensations. (467)

## III. Fechner's device of taking as unit the least perceptible difference. (468)

- (1) How can there be a 'least perceptible' difference? (469)
- (2) This difference assumed to be a fixed or constant one. (470)
- (3) Such a unit unsuitable for intercomparison. (472)
- (4) Special unit needed for each kind of sensation. (473)

## CHAPTER XX.

Geometrical data: discussion of some of the difficulties commonly felt in their realization. (pp. 474—496)

## I. The Nature of Lines and Surfaces:

These not so much distinct entities, as boundaries of what are such: i.e. they are abstractions. (475—478)

But the materials from which they are abstracted are refined to an ideal degree. (478—481)

Examination of a difficulty here; the possibility of contradictory attributes being assigned to the same boundary: similar difficulty in the case of *Time*. (481)

## II. Are these lines and surfaces presented to, or constructed by us?

Difficulty here about 'infinite' curves. (484)

Example of a curve infinite in one direction only. (487)

## III. The 'parts' of a line are what we conceive, or make such; not previously existent there. (489)

## IV. Principles of the Differential Calculus as applied to Geometry: i.e. the exact indication of a precise result by a process which involves the conception of endless progression. (490)

Illustration of some other similar methods of procedure. (491—496)

## CHAPTER XXI.

Explanation and Verification, as steps towards the methodization and establishment of our knowledge of Nature. (pp. 497—514)

Description of the primitive attitude towards the phenomena of Nature which renders explanation desirable. How is this met?

- (1) Satisfaction is yielded by mere restatement in a wider form : i.e. by taking a fact out of its state of isolation. (499)
- (2) The assignment of a concrete ' Cause,' or group of Antecedents. (500)
- (3) The completer scientific, or analytic, procedure ; takes generally one of the following forms :—
  - i. Generalization to the utmost, in the case of ultimate facts or laws. (501—503)
  - ii. Resolution of the complex into simpler and more general laws. (504)
  - iii. Interposition of intermediate links in a seemingly immediate sequence. (505)

Explanation of Facts and of Laws. (507)

Are Explanation and Verification ever one and the same thing? (509)

Verification can never yield absolute certainty. (510)

The Limits of Explanation. (511, 512)

Examples of attempted explanation. (513)

## CHAPTER XXII.

A Universal or Perfect Language. (pp. 515—535)

- I. The main practical reasons which have furnished occasion for schemes of this kind ; and the probable practical solution of the question. (515—518)
- II. For philosophical purposes there are demanded :—
  - (1) Some direct representation of common ideas ; i.e. more than a mere short-hand substitution for words. (519, 520)
  - (2) A scientific system of classification of objects or ideas. (521)
  - (3) A suitable set of corresponding symbols. (522, 523)
- III. Brief account of two such scientific attempts :—
  - (1) The scheme of Leibnitz. (524—526)
  - (2) That of Wilkins. (526)

Remarks on the present drift of practice and opinion in these directions. (533—535)

## CHAPTER XXIII.

Extensions of our General powers of observation ; or the nature and limits of our control over Space and Time. (pp. 536—552)

There are three main respects in which such extensions can be either attained or conceived :—

- I. We want to get not only as close as possible to the object, but into any desired relative position towards it. (537—540)
- To what extent is such an attitude conceivable in respect of *time*? (540)
- A partial substitute is found here in the aid afforded by the Comparative Sciences. (542)

- II. Owing to the inconveniently small or large size of many objects, it would be desirable to be able actually to alter their magnitudes at will. (544, 545)
- III. Failing the possibility of the last device, we endeavour to aid or intensify the powers of our own organs:—  
 In respect of *sight* this is attained by the use of the microscope. (546)  
 Conceivable analogies in the case of the other senses. (547)  
 Can we conceive methods of *time*-magnification? (549—552)

## CHAPTER XXIV.

The Ideal of Logic and Methodology ; or the degree and kind of knowledge at which Induction may legitimately aim. (pp. 553—567)

- I. As regards the range or extent, we want;—
- (1) Knowledge of any assignable concrete facts, at any remove in time or space from our present position. (553—555)
  - (2) A complete system of analysis of these facts; i.e. perfect simplification of the laws, and final classification of the phenomena. (555—562)
- II. Quantitatively, we desire;—
- (1) A complete set of units for all measurable phenomena. (563)
  - (2) Consequent determination of the magnitudes. (563)
- III. And, as regards what must still remain uncertain, we want:—
- (1) Assignment of probability, or due amount of belief; whether (i) statistical, or (ii) by estimate. (564—566)
  - (2) Assignment of the 'probable error' of the above result. (567)

## CHAPTER XXV.

Speculation and Action ; or the Logical and Scientific view of the world as modified by our practical tendencies. (pp. 568—599)

General contrast between Science and Art, in their widest sense; discussion of the attitude appropriate to each. (568—574)

This appropriate attitude is often deserted by the logician or speculator:—

- I. He makes actual transgressions into practice; but such as, by not invalidating any inference, may be described as legitimate:
- (1) Some of these are on such a small scale as to make no alteration of the statistical average. (574)
  - (2) Others are on a more extensive and serious scale. (575—577)  
 Critical discussion of the difference between actions justifiable from the individual, and from a common stand-point: examples from Ethics, Political Economy, &c. (578—584)
- II. Transgressions which may be called illegitimate, as tending to invalidate otherwise trustworthy inferences. (584—588)
- III. Hypothetical, as opposed to actual interferences. Want of discrimination as to the nature and limits of such hypotheses often produces serious fallacy, and leads to both under-estimate and over-estimate of the effective influence of individual agency. (588—599)
