

CONTENTS

Chapter 1. Introduction	1
1.1. What is model theory?	1
1.2. Model theory for sentential logic	4
1.3. Languages, models and satisfaction	18
1.4. Theories and examples of theories	36
1.5. Elimination of quantifiers	49
Chapter 2. Models constructed from constants	61
2.1. Completeness and compactness	61
2.2. Refinements of the method. Omitting types and interpolation theorems	76
2.3. Countable models of complete theories	93
Chapter 3. Further model-theoretic constructions	107
3.1. Elementary extensions and elementary chains	107
3.2. Applications of elementary chains	123
3.3. Skolem functions and indiscernibles	141
3.4. Some examples	155
Chapter 4. Ultraproducts	164
4.1. The fundamental theorem	164
4.2. Measurable cardinals	179
4.3. Regular ultrapowers	200
Chapter 5. Saturated and special models	214
5.1. Saturated and special models	214
5.2. Preservation theorems	227

5.3. Applications of special models to the theory of definability.	244
5.4. Applications to field theory	263
5.5. Application to Boolean algebras	293
Chapter 6. More about ultraproducts and generalizations	305
6.1. Ultraproducts which are saturated	305
6.2. Direct products, reduced products, and Horn sentences	326
6.3. Direct products, reduced products, and Horn sentences (con- tinued)	341
6.4. Limit ultrapowers and complete extensions	368
6.5. Iterated ultrapowers	381
Chapter 7. Selected topics	401
7.1. Categoricity in power	401
7.2. An extension of Ramsey's theorem and applications; some two-cardinal theorems	427
7.3. Models of large cardinality	450
7.4. Large cardinals and the constructible universe	474
Appendix A. Set theory	494
Appendix B. Open problems in classical model theory	512
Historical notes	517
References	534
Index of definitions	547
Index of symbols	553
