<i>List of symbols</i>	xi
<i>Preface</i> by Prof. Raymond T. Yeh	xiii
<i>Introduction</i>	xv
<i>Chapter 1: Algebraic structures</i>	1
1.1. Binary relations	1
1.1.1. Binary relations between two sets	1
1.1.2. Binary relations on a set	4
1.1.3. Equivalence relations	5
1.1.4. Order relations; duality	6
1.2. Universal algebras	7
1.3. Lattice theory	10
1.3.1. Semilattices	10
1.3.2. Lattices	13
1.3.3. Distributive, complemented and metric lattices	18
1.3.4. Boolean algebras	22
1.3.5. Closure systems and operators	26
1.4. Module theory	31
1.4.1. Groups	31
1.4.2. Rings	34
1.4.3. Fields	40
1.4.4. Matrices	47
1.4.5. Modules	53
1.5. Enumeration orders; Kronecker product	61
1.5.1. Lexicographical order; numeration systems	61
1.5.2. Gray code	63
1.5.3. Kronecker product of matrices	65
<i>Chapter 2: Elementary theory of discrete functions</i>	73
2.1. Graphical representation methods	73
2.1.1. Definitions and elementary representations	73
2.1.2. Graphical and tabular representation methods	80
2.1.3. Computation schemes and discrete functions of functions	85

2.2. The lattice structure of discrete functions	91
2.2.1. Definitions and lattice notations	91
2.2.2. Lattice expressions and their manipulation	96
2.2.3. Lattice canonical forms	101
2.3. The module structure of discrete functions	106
2.3.1. Definitions and ring notations	106
2.3.2. The Lagrange canonical form	109
2.3.3. Transformation of a lattice expression into a ring expression and vice versa	111
2.4. The linear algebra structure of Galois functions	117
2.4.1. Definitions and field notations	117
2.4.2. Polynomial expansions of Galois functions	119
<i>Chapter 3: Lattice expressions of discrete functions</i>	129
3.1. Definitions	130
3.2. Prime implicant and prime implicate extraction methods	141
3.2.1. The Karnaugh map of two-dimensional discrete functions	142
3.2.2. The implicant–implicate method	148
3.2.3. The lattice difference algorithms	153
3.2.3.1. The lattice differences of discrete functions	153
3.2.3.2. The extended vector algorithm	162
3.2.3.2.1. Fundamental form	163
3.2.3.2.2. Modified form	173
3.2.3.3. The lattice difference algorithm	176
3.2.3.4. The lattice differences and the consensus theory	185
3.2.3.5. The Quine–McCluskey algorithm	193
3.2.3.6. Iterative forms for switching functions	198
3.3. Applications	202
3.3.1. Research of the maximal compatibility classes of a compatibility relation	202
3.3.2. Representation of fuzzy functions	205
3.3.2.1. Preliminaries	206
3.3.2.2. Unique representation of a fuzzy function	207
3.3.2.3. The lattice of fuzzy functions compatible with a given switching function	210
3.3.2.4. Prime implicants and prime implicates of fuzzy functions	213
3.3.3. Hazard detection in switching networks by fuzzy functions	218
3.3.3.1. Hazards	218
3.3.3.2. Static hazard detection by means of fuzzy simulation	221
3.3.3.3. Logic static hazard detection by means of fuzzy prime implicants and prime implicates	226

3.3.4. Introduction to switching and to logic design	229
3.3.4.1. Two-level logic networks	229
3.3.4.2. Cellular and hazard-free design of switching networks	231
<i>Chapter 4: Ring expressions of discrete functions</i>	237
4.1. Bases, associated operators and expansions	237
4.2. Kronecker bases and associated ring expansions	245
4.2.1. Coherent Kronecker bases	245
4.2.1.1. The binomial bases, the ring differences and the Newton expansions	245
4.2.1.1.1. General theory	245
4.2.1.1.2. Switching functions	258
4.2.1.2. The step function bases and the Nyquist expansions	274
4.2.1.3. The cube function bases and the Kodandapani expansions	282
4.2.2. Change of Kronecker bases	287
4.2.3. Non-coherent Kronecker bases	293
4.3. Other types of ring expansions for switching functions	297
4.4. Applications	301
4.4.1. Network synthesis	301
4.4.2. Network diagnosis	307
4.4.3. Synthesis of easily testable networks	313
<i>Chapter 5: Field expressions of Galois functions</i>	317
5.1. The Taylor expansions and the derivatives of Galois functions	317
5.2. Applications	333
5.2.1. Derivatives and computation of Stirling numbers	333
5.2.2. Logic design	336
Appendix: Derivation operators over polynomials	343
<i>Chapter 6: Minimization of ring expansions</i>	353
6.1. Minimization of canonical ring expansions with coherent bases	353
6.1.1. Exhaustive minimization methods	354
6.1.1.1. Row-wise and column-wise construction of the polarity coefficient matrix	354
6.1.1.2. The Marinkovic–Tosic procedure and the Gray code approach	356

6.1.2. Non-exhaustive minimization methods for Galois functions	358
6.1.2.1. Methods grounded on the extended vector	358
6.1.2.1.1. Extended vectors for Newton and for Taylor—Maclaurin expansions	359
6.1.2.1.2. Minimal Newton expansions	361
6.1.2.1.3. Minimal Taylor—Maclaurin expansions	367
6.1.2.2. Methods for switching functions based on the use of real connectives	369
6.1.3. Complexity of Reed—Muller minimization algorithms	376
6.2. The general minimization problem for switching functions	378
6.2.1. Minimization of Kronecker expansions	379
6.2.2. Minimization of generalized Reed—Muller expansions	380
6.2.3. Minimization of pseudo-Kronecker expansions	382
6.2.4. Minimization of general ring-sum expansions	384
6.2.4.1. Reed—Muller weight-vector and N -equivalence	385
6.2.4.2. The D -equivalence	386
6.2.4.2.1. Definition: invariants of the D -classes	386
6.2.4.2.2. D -equivalent N -classes	387
6.2.4.3. Cost of the D -classes	388

Chapter 7: Difference and differential calculus for discrete functions 395

7.1. Difference and differential operators for discrete functions	395
7.1.1. Total differences and increments of discrete functions	396
7.1.2. Total derivatives and differentials of Galois functions	401
7.1.3. Lattice differences and variations of discrete functions of functions	404
7.2. Difference and differential operators for switching functions	412
7.3. Applications	423
7.3.1. Transient analysis of switching networks	423
7.3.1.1. Function hazard detection	423
7.3.1.2. Logic hazard detection	426
7.3.2. Fault detection	429
7.3.3. Sequential switching network description and analysis	433
7.3.3.1. Introduction to sequential logic	433
7.3.3.2. Representations of asynchronous networks working in the fundamental mode	436
7.3.3.3. Hazard detection in asynchronous networks	440
7.3.3.4. Delay conditions and sequential hazards	446
7.3.3.5. Fault detection in asynchronous switching circuits	451

<i>Chapter 8: The optimal covering problem</i>	457
8.1. The covering problem	458
8.1.1. General statement	458
8.1.2. General methods of solution	460
8.1.3. Minimization of discrete functions	471
8.2. The covering-closure problem	480
8.2.1. General statement	481
8.2.2. General methods of solution	483
8.2.3. Minimization of finite automata	495
8.3. Comments	501
<i>Chapter 9: Functional completeness</i>	503
9.1. Closed classes	503
9.2. The functional completeness in binary logic	505
9.3. The functional completeness in r -ary logic	509
9.4. The Slupecki theorem	516
9.5. Examples	520
<i>Chapter 10: Complexity of logic functions</i>	525
10.1. Complexity measures	525
10.2. The computation complexity	528
10.3. The time complexity	537
10.4. Universal logic modules	540
10.5. Conclusion	543
<i>Chapter 11: Decomposition</i>	545
11.1. Decomposition of discrete functions	545
11.1.1. Generalities and main definitions	545
11.1.2. Disjunctive treelike decompositions	548
11.1.3. Some other types of decompositions	552
11.2. Decomposition of switching functions	557
11.2.1. Partition matrices and decomposition charts	557
11.2.2. Application of the differential calculus	562
11.2.3. Lattice of the bound sets	567
11.2.4. Concluding remarks	587

<i>Chapter 12: Unateness</i>	589
12.1. Unate discrete functions	590
12.2. Envelopes associated with discrete functions	592
12.3. Local unateness in discrete functions	597
12.4. Hazard-free transitions of discrete functions	599
12.5. Switching functions	601
12.6. Applications	607
12.6.1. Hazard-free synthesis of logic and of switching networks	607
12.6.2. Transient analysis of switching networks	614
12.6.2.1. Hazard detection	614
12.6.2.2. Detection of malfunctions	618
12.6.2.2.1. Definitions and network model	618
12.6.2.2.2. Theorems and computational methods	622
12.6.2.3. Example of transient analysis of a logical network	624
12.6.3. Fault detection in unate switching networks	634
 <i>Chapter 13: Symmetry</i>	 637
13.1. Introduction of the main concepts	637
13.1.1. Definitions	637
13.1.2. Partial symmetry and ρ -symmetry	639
13.1.3. Logic functions; carrier functions	641
13.2. Algebraic structures	644
13.2.1. The lattice structure	646
13.2.2. The module structure	649
13.3. Imbedding in a totally symmetric function	663
13.4. Detecting of the symmetries	666
13.5. Cellular synthesis	672
13.6. Switching functions	684
13.6.1. The carrier function	684
13.6.2. Algebraic structures	689
13.6.3. Cellular realization	692
