

CONTENTS

Introduction	xi
Part I The formalization of number theory	1
1. Proving some basic results	3
Divisibility and primes – The Fundamental Theorem of Arithmetic – The Euclidean Algorithm – The infinitude of the primes – The Chinese Remainder Theorem – Gödel's β -function – The question of elementary methods	
2. Eliciting assumptions	13
Eliciting assumptions: a first example – A 'direct' proof – <i>Reductio ad absurdum</i> – Mathematical induction – Excluded middle and proof by cases – Summary of principles	
3. Testing the soundness of logical assumptions	24
Is there a test for soundness? – Constructing truth tables – The truth tables – A short truth table method – Some useful equivalences – Predicate logic	
4. Problems in the foundations of mathematics	31
Intuitions and axioms – Infinite sets and the diagonal method: Cantor's set theory – Explicit logical axioms for mathematics: Frege's logicism – Russell's paradox discovered – Finitism and formalism: Hilbert's programme – Decidable predicates and formal theories – The notion of formal proof and first-order theory – Gödel numbering – Arithmetization and metamathematics	
5. The formal theory N introduced	42
The symbols of the theory – Formation rules – Scope of an operator – Free and bound variables – Substitution – The axioms and rules for N – Proof-finding made easier – Deduction from assumptions – The Deduction Theorem – Introduction and elimination rules	
6. Some theorems of N	58
Properties of '=' – The Replacement Theorem – Properties of +, ·, ', and 0 – Order properties in N – Existence and uniqueness of quotient	

and remainder – The least number principle – Euclid's Theorem – Equivalents of mathematical induction – Questions about completeness	
7. A complete theory for addition	72
Disjunctive normal form – Prenex normal form – The formal theory D – The Reduction Algorithm – Completeness and decidability of D – Properties of congruences – Exercises for Chapter 7	
Part II Computability, incompleteness, and undecidability	85
8. Introducing register machines	87
Intuitions about computability – The unlimited register ideal machine described – Drawing flow diagrams – Building from 'subprograms' – Multiplying the contents of R_i and R_j – The algorithm for writing programs from flow diagrams – R-computability defined – Church's Thesis	
9. Programming computations	99
Examples of R-computable functions – Computability of formal notions – ν is the gödel number of a term – A summary outline – Checking the flow diagram – ν is the gödel number of a formula – Extrapolation	
10. Numeralwise representation	112
Numeralwise expressibility and representability – The numeralwise representability of R-computable functions	
11. Incompleteness of the formal theory	119
The incompleteness of N – the unprovability of consistency – Developments using the diagonal function – R-decidability – Tarski's Theorem	
12. Undecidable problems	127
The formal theory Q ⁺ – The representability of R-computable functions in Q ⁺ – Church's Theorem – The halting problem – Gödel numbering programs – The universal R-machine – The unsolvability of the halting problem	
Appendix: answers to exercises	136
