

CONTENTS

Chapter I. Introduction	9
1. Notation and basic concepts	9
2. The axioms of Zermelo–Fraenkel set theory	13
3. Ordinals, cardinals, and order types	16
4. Basic tools of set theory	21
Chapter II. Preliminaries	34
5. Stationary sets	34
6. Equalities and inequalities for cardinals	39
7. The logarithm operation	45
Chapter III. Fundamentals about partition relations	52
8. A guide to partition symbols	52
9. Elementary properties of the ordinary partition symbol	62
10. Ramsey’s theorem	65
11. The Erdős–Dushnik–Miller theorem	70
12. Negative relations with infinite superscripts	78
Chapter IV. Trees and positive ordinary partition relations	80
13. Trees	80
14. Tree arguments	82
15. End-homogeneous sets	86
16. The Stepping-up Lemma	90
17. The main results in case $r=2$ and κ is regular; and some corollaries for $r \geq 3$	93
18. A direct construction of the canonical partition tree	100
Chapter V. Negative ordinary partition relations, and the discussion of the finite case	105
19. Multiplication of negative partition relations for $r=2$	105
20. A negative partition relation established with the aid of GCH	110
21. Addition of negative partition relations for $r=2$	113
22. Addition of negative partition relations for $r \geq 3$	117
23. Multiplication of negative partition relations in case $r \geq 3$	122
24. The Negative Stepping-up Lemma	132
25. Some special negative partition relations for $r \geq 3$	138
26. The finite case of the ordinary partition relation	145

Chapter VI. The canonization lemmas	158
27. Shelah's canonization	158
28. The General Canonization Lemma	163
Chapter VII. Large cardinals	168
29. The ordinary partition relation for inaccessible cardinals	168
30. Weak compactness and a metamathematical approach to the Hanf–Tarski result ...	177
31. Baumgartner's principle	188
32. A combinatorial approach to the Hanf–Tarski result	194
33. Hanf's iteration scheme	200
34. Saturated ideals, measurable cardinals, and strong partition relations	201
Chapter VIII. Discussion of the ordinary partition relation with superscript 2	215
35. Discussion of the ordinary partition symbol in case $r=2$	215
36. Discussion of the ordinary partition relation in case $r=2$ under the assumption of GCH	226
37. Sierpiński partitions	229
Chapter IX. Discussion of the ordinary partition relation with superscript ≥ 3	233
38. Reduction of the superscript	233
39. Applicability of the Reduction Theorem	240
40. Consequences of the Reduction Theorem	243
41. The main result for the case $r \geq 3$	253
42. The main result for the case $r \geq 3$ with GCH	259
Chapter X. Some applications of combinatorial methods	263
43. Applications in topology	263
44. Fodor's and Hajnal's set-mapping theorems	272
45. Set mappings of type > 1	275
46. Finite free sets with respect to set mappings of type > 1	285
47. Inequalities for powers of singular cardinals	288
48. Cardinal exponentiation and saturated ideals	301
Chapter XI. A brief survey of the square bracket relation	313
49. Negative square bracket relations and the GCH	313
50. The effect of a Suslin tree on negative relations	318
51. The Kurepa Hypothesis and negative stepping up to superscript 3	321
52. Aronszajn trees and Specker types (preparations for results without GCH)	324
53. Negative square bracket relations without GCH	327
54. Positive relations for singular strong limit cardinals	330
55. Infinitary Jónsson algebras	332
Bibliography	335
Author index	341
