

CONTENTS

Chapter I: Galois fields.

1. Some fundamental concepts	1
2. Finite fields	5
3. Irreducible and primitive polynomials	11

Chapter II: Linear recurrence.

1. Feedback shift registers	18
2. The difference equation	23
3. The matrix method; non-canonical registers	25
4. Reverse and symmetric sequences	30
5. Recurrence over arbitrary finite fields	33
6. Historical survey	35

Chapter III: The difference equation.

1. The solution space	39
2. Fundamental identities	42
3. The classical method	46
4. The method of Ward and Hall	51
5. The method of Peterson and Laksov	52
6. The method of Zierler	55

Chapter IV: The cycle structure.

1. The minimum polynomial	62
2. Regular sequences	65
3. Sequences of determinants	68
4. Sum and intersection	75
5. Repeated factors	80
6. The general case	84
7. Multiplication of sequences	90

Chapter V: Distribution problems.

1. Multipliers and blocks	98
2. Definition of multigrams	103
3. Structure and distribution of multigrams	108
4. Equations for the numbers of zeros	113
5. Equidistribution of elements in sequences	121
6. Decimation of periodic sequences	126
7. Invariance under decimation	132
8. Hall's homomorphism	138
9. The unit sequences	142
10. The power sum sequence \tilde{s}	145
11. Addition and subtraction formulas	150

Chapter VI: Binary sequences.

1. The number of cycles	154
2. Binary complementation	156
3. Autocorrelation	161
4. Golomb's randomness postulates	169
5. Difference sets and difference cycles	172

Chapter VII: The matrix method.

1. Introduction	178
2. Vector recurrence and sequence rank	180
3. The general theory	186
4. Some special cases	191
5. On the number of matrices	198
