

Contents

Preface	xiii
Acknowledgments	xv
<i>I. Introduction</i>	1
1. Eigenvalues	3
2. Pseudospectra of matrices	12
3. A matrix example	22
4. Pseudospectra of linear operators	27
5. An operator example	34
6. History of pseudospectra	41
<i>II. Toeplitz Matrices</i>	47
7. Toeplitz matrices and boundary pseudomodes	49
8. Twisted Toeplitz matrices and wave packet pseudomodes	62
9. Variations on twisted Toeplitz matrices	74
<i>III. Differential Operators</i>	85
10. Differential operators and boundary pseudomodes	87
11. Variable coefficients and wave packet pseudomodes	98
12. Advection-diffusion operators	115
13. Lewy–Hörmander nonexistence of solutions	126
<i>IV. Transient Effects and Nonnormal Dynamics</i>	133
14. Overview of transients and pseudospectra	135
15. Exponentials of matrices and operators	148
16. Powers of matrices and operators	158
17. Numerical range, abscissa, and radius	166
18. The Kreiss Matrix Theorem	176
19. Growth bound theorem for semigroups	185
<i>V. Fluid Mechanics</i>	193
20. Stability of fluid flows	195
21. A model of transition to turbulence	207
22. Orr–Sommerfeld and Airy operators	215
23. Further problems in fluid mechanics	224

<i>VI. Matrix Iterations</i>	229
24. Gauss–Seidel and SOR iterations	231
25. Upwind effects and SOR convergence	237
26. Krylov subspace iterations	244
27. Hybrid iterations	254
28. Arnoldi and related eigenvalue iterations	263
29. The Chebyshev polynomials of a matrix	278
<i>VII. Numerical Solution of Differential Equations</i>	287
30. Spectral differentiation matrices	289
31. Nonmodal instability of PDE discretizations	295
32. Stability of the method of lines	302
33. Stiffness of ODEs	314
34. GKS-stability of boundary conditions	322
<i>VIII. Random Matrices</i>	331
35. Random dense matrices	333
36. Hatano–Nelson matrices and localization	339
37. Random Fibonacci matrices	351
38. Random triangular matrices	359
<i>IX. Computation of Pseudospectra</i>	369
39. Computation of matrix pseudospectra	371
40. Projection for large-scale matrices	381
41. Other computational techniques	391
42. Pseudospectral abscissae and radii	397
43. Discretization of continuous operators	405
44. A flow chart of pseudospectra algorithms	416
<i>X. Further Mathematical Issues</i>	421
45. Generalized eigenvalue problems	423
46. Pseudospectra of rectangular matrices	430
47. Do pseudospectra determine behavior?	437
48. Scalar measures of nonnormality	442
49. Distance to singularity and instability	447
50. Structured pseudospectra	458
51. Similarity transformations and canonical forms	466
52. Eigenvalue perturbation theory	473
53. Backward error analysis	485
54. Group velocity and pseudospectra	492

<i>XI. Further Examples and Applications</i>	499
55. Companion matrices and zeros of polynomials	501
56. Markov chains and the cutoff phenomenon	508
57. Card shuffling	519
58. Population ecology	526
59. The Papkovich–Fadle operator	534
60. Lasers	542
References	555
Index	597
