

CONTENTS

<u>CHAPTER ONE. EXPLICIT CONSTRUCTIONS OF UNIVERSAL EXTENSIONS</u>	1
§1. Group schemes and their relations to vector groups	1
§2. Rigidification of Hom and Ext	13
§3. Rigidified extensions and \mathcal{H} -extensions	26
§4. The Relation between one dimensional De Rham cohomology and the Lie Algebra of the universal extension	44
§5. Fragmentary comments concerning Néron models and universal extensions	53
<u>CHAPTER TWO. UNIVERSAL EXTENSIONS AND CRYSTALS</u>	60
General Introduction	60
§1. The crystalline nature of the universal extension of an abelian scheme	62
§2. Stability of $(\varepsilon_{m,n})$ -Hom \mathcal{H}	67
§3. Extensions of truncated Barsotti-Tate groups by G_a	69
§4. On the existence of \mathcal{H} -structures	71
§5. Relation between Ext \mathcal{H} and ε -Hom \mathcal{H}	75
§6. Crystalline extensions and \mathcal{H} -extensions	76
§7. The Crystalline nature of Ext $\mathcal{H}(-, G_a)$	82
§8. Passage to Lie Algebras	90
§9. The crystalline nature of the Lie Algebra of the universal extension	93
§10. A deformational duality theorem for Barsotti-Tate groups: an easy consequence of the theory of Illusie	95
§11. The crystalline nature of the formal completion of the universal extension	106
§12. The crystalline nature of the universal extension (on the nilpotent crystalline site)	115
§13. Relation between the universal extension crystal of an abelian variety and that of its associated Barsotti-Tate group	119
§14. <u>Appendix</u> : Grothendieck's duality formula for the Lie complex	123
§15. <u>Appendix II</u> : Comparison with classical Dieudonné theory	126
