<i>Lecturers</i>	viii
<i>Participants</i>	ix
<i>Preface (in French and English)</i>	xiii
<i>Course 1. Mathematics and physics since 1800 (Discord and sympathy), by Res Jost</i>	1
1. Introduction	4
2. Gauss and the development of number theory	5
3. Faraday and the development of field theory	20
<i>Course 2. Some chapters for a history of quantum field theory: 1938–1952, by S.S. Schweber</i>	37
Introduction	40
1. The Forman thesis	45
2. P.A.M. Dirac and the birth of quantum field theory	50
2.1. The birth of quantum electrodynamics	59
2.2. Relativistic quantum mechanics	66
2.3. Hole theory	78
2.4. Vacuum polarization	86
2.5. Epilogue	90
Appendix 2A	91
3. The thirties	92
3.1. General physics background	93

3.2. Dirac's hole theory	101
3.3. Fermi and the regaining of <i>Anschaulichkeit</i>	108
3.4. Kramers' viewpoint	112
4. World War II and its aftermath	114
4.1. The war years	114
4.2. The 1945–1947 period	120
4.2.1. The universities	120
4.2.2. The conferences	121
Appendix 4A	126
5. The Shelter Island conference	128
Introduction	128
5.1. The genesis of the conference	129
5.2. The scientific content of the conference	151
5.3. The later developments	163
5.4. Relativistic Lamb-shift calculations: 1947	172
Appendix 5A	181
Appendix 5B	182
Appendix 5C	183
Appendix 5D	184
Appendix 5E	185
Appendix 5F	186
6. Feynman and the visualization of atomic processes	186
Bibliography	202

*Course 3. Topological investigations of quantized gauge theories,
by R. Jackiw; notes by R. Young* 221

1. Introduction	224
2. Description of vector gauge theories	226
2.1. Action and equations of motion	226
2.2. Symmetries	230
2.3. Couplings to matter fields	239
2.4. Classical gauge fields	245
3. Quantization	252
3.1. Constrained quantum mechanical example	252
3.2. Quantizing a Yang–Mills theory	256
3.3. θ angle	261
3.4. Functional integral formulation	266
3.5. Semi-classical picture for the vacuum angle	270
4. Fermion interactions and anomalies	274
4.1. Quantized fermions	274
4.2. Gauge invariance and fermion couplings	276

4.3. Chiral (or axial vector) anomalies	277
4.4. Some physical consequences of anomalies	286
5. Quantization constraints on physical parameters	290
5.1. Dirac point monopole	291
5.2. Three-dimensional gauge theories	294
5.3. Four-dimensional gauge theories	308
5.4. Discussion	311
6. Conclusions	312
Solutions to selected exercises	313
Notes and references	325
<i>Course 4. Quantum cosmology, by S.W. Hawking</i>	<i>333</i>
1. Introduction	336
2. Euclidean quantum field theory	338
3. Quantum fields in curved space	341
4. GUT era inflation	342
4.1. The old Inflationary Model	345
4.2. The new Inflationary Model	348
4.3. Euclidean formulation of the Inflationary Model	350
4.4. Growth of irregularities in the Inflationary Model	353
5. Quantum gravity	355
6. The conformal factor	361
7. The boundary conditions	362
8. Minisuperspace	364
8.1. De Sitter space	364
8.2. Our Universe?	369
9. Conclusion	376
References	379
<i>Course 5. The spacetime approach to quantum field theory, by Bryce DeWitt</i>	<i>381</i>
<i>I. Superclassical dynamical systems</i>	<i>388</i>
1. Fundamentals	388
1.1. Introduction	388
1.2. Superclassical dynamical systems	389
1.3. Field histories	390

1.4.	Notational abbreviations	391
1.5.	Condensed and supercondensed notations	393
1.6.	Changing topology	394
2.	Dynamics and invariance transformations	395
2.1.	The action functional and the dynamical equations	395
2.2.	Invariance transformations	397
2.3.	Commutator of invariance transformations. Orbits	399
2.4.	Physical observables	401
2.5.	Invariant measure for the space of histories	402
2.6.	Gauge groups and Ward identities	404
2.7.	The recommended way to read these lecture notes	406
3.	Small disturbances and Green's functions	407
3.1.	The equations of small disturbances	407
3.2.	The structure of ${}_i S_j$	408
3.3.	The Wronskian operator	409
3.4.	Supplementary conditions	409
3.5.	A natural choice for the supplementary condition	411
3.6.	Retarded and advanced Green's functions of F	415
3.7.	Reciprocity relations	416
3.8.	Green's functions of \mathfrak{F}	417
3.9.	The Landau Green's functions	418
4.	The Peierls bracket	419
4.1.	Disturbances in physical observables	419
4.2.	Invariance properties of $D_A^\pm B$	421
4.3.	The Peierls bracket and the supercommutator function	424
4.4.	The bracket identities	425
4.5.	The Cauchy problem for Jacobi fields	427
5.	Finite disturbances	429
5.1.	Differential and integro-differential equations for finite disturbances	429
5.2.	Formal solutions. Tree functions	431
5.3.	Transformation laws	432
5.4.	Changes in P and η	433
5.5.	Gauge transformations	434
5.6.	Tree amplitudes and tree theorems	435
5.7.	Changes in the choice of dynamical variables	437
5.8.	"In" and "out" fields	439
6.	Conservation laws	443
6.1.	Alternative action functional	443
6.2.	Sources	443
6.3.	Killing fields, currents and charges	444
6.4.	The charge group	446
6.5.	Fundamental lemma (24)	448
6.6.	A special transformation	449
6.7.	The Peierls bracket (q_A, q_B)	451
6.8.	The view from spatial infinity	454

6.9.	Compact universes and linearization constraints	456
6.10.	Pseudocovariants	457
6.11.	External fields	458
6.12.	Charges in external fields	460
6.13.	Peierls bracket for the charges	461
6.14.	Differences from the previous theory	462
 <i>II. Quantum dynamical systems</i>		 470
7.	Quantization	470
7.1.	The quantization rules	470
7.2.	The Schwinger variational principle	473
7.3.	Switching-on interactions	475
7.4.	External sources and chronological products	476
7.5.	Chronologically ordered form of the operator dynamical equations	478
7.6.	The Feynman functional integral	481
8.	Linear boson fields in stationary backgrounds	487
8.1.	The scalar field	487
8.2.	The field equations	489
8.3.	The energy	491
8.4.	Mode functions	494
8.5.	The general solution	496
8.6.	Mode-function relations	497
8.7.	Mode functions for the scalar field	498
8.8.	Vector and tensor fields	500
8.9.	When the energy is unbounded from below	505
8.10.	When $K^{-1}M$ is fully diagonalizable and has imaginary eigenvalues	507
8.11.	When the operator \tilde{C} is semidefinite. Massless fields in compact universes	509
8.12.	Mode functions. Zero-frequency modes	512
8.13.	The general solution. The total energy	514
8.14.	Mode-function relations	515
9.	Quantization of linear boson fields	518
9.1.	Green's functions	518
9.2.	Quantization	519
9.3.	Fock space	520
9.4.	Representation of the operators q and p	524
9.5.	Nonstationary backgrounds and inequivalent vacua	525
9.6.	The Feynman propagator	527
9.7.	The heat kernel	529
9.8.	Auxiliary geometrical quantities	531
9.9.	Solution of the heat equation	534
9.10.	The Hadamard function	536
10.	Linear fermion fields in stationary backgrounds	539
10.1.	Local Lorentz frames	539
10.2.	Generators of frame rotations	541

10.3.	The Dirac matrices	542
10.4.	Spin structures	544
10.5.	Spinor fields	545
10.6.	The spin connection	547
10.7.	Real representations	548
10.8.	Lagrange function, field equation and stress-energy density	549
10.9.	Energy (58)	551
10.10	The Dirac operator	553
10.11.	Stationary backgrounds. A special field of local Lorentz frames	554
10.12.	A model system	555
10.13.	Mode functions	556
11.	Quantization of linear fermion fields	562
11.1.	Green's functions	562
11.2.	Quantization	562
11.3	Fock space	563
11.4.	Hole theory	565
11.5.	The Feynman propagator	567
11.6.	The heat kernel	570
12.	Linear fields in nonstationary backgrounds	572
12.1.	"In" and "out" regions	572
12.2.	Bogoliubov relations	575
12.3.	"In" and "out" Fock spaces and the S -matrix	577
12.4.	Particle production and annihilation amplitudes	578
12.5.	One-"particle" scattering amplitude	582
12.6.	Nonsingularity of α	583
12.7.	Unitarity. The vacuum-to-vacuum amplitude	584
12.8.	Unitarily inequivalent Fock spaces	586
12.9.	Green's-function representation of e^{iW}	588
12.10.	Introduction of external sources	590
12.11.	Functional integral representation of e^{iW_J}	593
12.12.	Heat-kernel representation of W	594
12.13.	Dimensional regularization	596
12.14.	Zeta-function representation of W	599
<i>III. Nonlinear quantized fields</i>		605
13.	Fields possessing invariant flows in the case $T''_{\alpha\beta} = 0$	605
13.1.	A special choice of variables	605
13.2.	The Feynman functional integral when $T''_{\alpha\beta} = 0$	607
13.3.	Alternative forms for the Feynman functional integral	610
13.4.	Ghost fields	612
13.5.	The one-loop approximation	614
14.	Linearized fields possessing invariant flows	615
14.1.	The electromagnetic field in a stationary curved background	615
14.2.	Other fields on stationary backgrounds	616
14.3.	Mode functions for F and $\bar{\mathcal{F}}$	618

14.4.	Mode-function decompositions of \tilde{G} and $\tilde{\mathfrak{G}}$	620
14.5.	Quantization	621
14.6.	Fields on nonstationary backgrounds	627
14.7.	Green's function representation of e^{iW}	628
14.8.	The measure functional	631
14.9.	Heat-kernel representation of W	632
15.	The Yang–Mills field	643
15.1.	Action functional	643
15.2.	Gauge transformations. Covariant differentiation	644
15.3.	Field equations. Small disturbances	646
15.4.	Natural metric and supplementary condition	647
15.5.	Finite disturbances. Killing fields and charges	648
15.6.	The linearized theory	650
15.7.	One-loop quantum theory	652
16.	The gravitational field	655
16.1.	Action functional	655
16.2.	Diffeomorphism group	655
16.3.	Field equations	656
16.4.	Small disturbances	657
16.5.	Natural metric	658
16.6.	Supplementary condition	664
16.7.	Finite disturbances. Gravitational stress-energy density	666
16.8.	The linearized theory	669
16.9.	One-loop quantum gravity	670
17.	S -matrix and effective action	676
17.1.	Asymptotics	676
17.2.	$ \text{in}, \text{vac}\rangle$ and $ \text{out}, \text{vac}\rangle$ as coherent states	678
17.3.	The S -matrix and the scattering operator	679
17.4.	The Lehmann–Symanzik–Zimmermann theorem	680
17.5.	Correlation functions for chronological averages when $T_{\alpha\beta} = 0$	684
17.6.	The effective action	688
17.7.	Full propagator, trees and full vertex functions	689
17.8.	Graphical representation of the effective action	691
17.9.	The Legendre transform	692
17.10.	When the source vanishes. The effective field	694
18.	The case $T_{\alpha\beta} \neq 0$	702
18.1.	The super Jacobi identity	702
18.2.	Generating functional for solutions of the super Jacobi identity	703
18.3.	Invariant functional integrals	705
18.4.	The Feynman functional integral when $T_{\alpha\beta} \neq 0$	708
18.5.	The one-loop approximation	710
18.6.	Generalized BRS transformations	710

<i>Appendix</i>	712
A.1. Supernumbers	712
A.2. Superanalytic functions	713
A.3. Integration	714
A.4. Supervector spaces	717
A.5. Bases	719
A.6. Change of basis	719
A.7. Shifting indices. The supertranspose	720
A.8. Dual supervector spaces	722
A.9. Dual bases	723
A.10. The supertrace and superdeterminant	724
A.11. Integration over $\mathbb{R}_c^m \times \mathbb{R}_a^n$	725
A.12. Transformation of variables	726
A.13. Gaussian integrals	729
A.14. Supermanifolds	731
A.15. Structures on supermanifolds	733
A.16. Super Lie groups	734
A.17. Super Hilbert spaces	736
A.18. Linear operators	737
A.19. Physical observables	738
<i>Course 6. Positive-energy theorems, by Yvonne Choquet-Bruhat</i>	739
Introduction	742
1. Definitions	743
1.1. Stress-energy \hat{g} -tensor	743
1.2. Energy-momentum \hat{g} vector	744
1.3. Asymptotically Minkowskian manifolds	747
1.3.1. ADM energy-momentum	751
1.4. Hamiltonian formulation	753
2. Positivity of mass in a neighborhood of Minkowski space	758
2.1. Functional spaces and isomorphism theorem	758
2.2. Time-symmetric initial data sets as minima of energy	759
2.3. Existence of maximal slices	760
2.4. The mass functional and its derivatives	762
3. The proof of Schoen and Yau	766
3.1. Second variation of the area	766
3.2. Metrics Euclidean outside of a compact set	767
3.3. Asymptotically Euclidean manifolds	768
3.3.1. Extension of the Schoen-Yau proof to the case $\text{tr} k \neq 0$	771
4. Witten's proof	772
4.1. Definition of the Witten two-form	773

4.2. Proof of positivity	775
4.3. Solution of the Witten equation	777
4.4. Zero energy implies flatness of space-time	778
5. Recent developments	779
5.1. Positive-mass theorem for black holes	779
5.2. The supergravity origin of Witten's expression	781
5.3. Asymptotically anti-De Sitter space-times	783
References	784

*Course 7. Lectures on the renormalization of gauge theories, by
C. Becchi* 787

Introduction	790
1. Quantum field theory and renormalization	791
1.1. Reduction formulae and S -matrix	791
1.2. Formal solution of the dynamical problem	792
1.3. Renormalization	794
1.4. The functional generator of 1PI diagrams	795
1.5. The renormalization of composite operators	797
1.5.1. A conserved-current operator	799
1.5.2. Renormalization of a model with isotopic-spin symmetry	799
2. Gauge theories	802
2.1. The introduction of vector fields	802
2.2. The Faddeev-Popov construction	804
2.3. Symmetry properties of the Faddeev-Popov action	806
2.4. Identification of a unique Lagrangian	807
2.5. Symmetry constraints in the functional framework	809
2.6. Discussion of the radiative corrections	811
2.7. The case of chiral fermions	814
2.8. Unitarity of the S -matrix	816
3. Conclusion	819
References	820
General references	820
A. Basic quantum field theory and renormalization	820
B. Gauge field theory	820
Specific references	820

Course 8. An introduction to simple supergravity and the Kaluza-Klein program, by P. Van Nieuwenhuizen 823

1. Introduction	826
2. Principles of supersymmetry	832

3. Simple supergravity in $d = 4$ dimensions	837
4. Majorana spinors in $d = t + s$ dimensions	843
5. Fierz rearrangements in $d = t + s$ dimensions	851
6. Supersymmetry of the action of simple supergravity in $d = 4$	853
7. The local algebra and auxiliary fields in $d = 4$	856
8. The cosmological constant, gauging and hidden symmetries	861
9. Simple supergravity in $d = 11$ dimensions	866
10. Vacuum solutions of $d = 11$ supergravity and their symmetries	872
11. Global vielbeins, spheres and octonions	876
12. Killing spinors and holonomy groups	880
13. The round and the squashed S_7 with(out) torsion	887
14. Spherical harmonics on S_n	890
15. Massless modes on the round S_7	893
16. Einstein metrics on coset manifolds	898
17. Mass formula for arbitrary Freund–Rubin backgrounds	908
Appendix I. Covariant derivatives in pure gravity with vielbeins	915
References	920
R1. References for sections 1–8	920
R2. Kaluza–Klein references up to February 1984	923

Course 9. The group manifold approach to unified gravity, by T. Regge 933

1. General relativity revisited	936
2. Supermanifolds, formalism and symbolism	946
3. Super Lie groups	951
4. More on superforms	959
5. Dimensional reduction	969
6. Spinors revisited	976
7. The general theory	987
Appendix A	1001
Appendix B	1001
References	1004

<i>Course 10. Remarks on infinite-dimensional Lie groups, by J. Milnor</i>	1007
1. Introduction	1010
2. Locally convex vector spaces	1019
3. Differential calculus	1023
4. Smooth manifolds and vector fields	1029
5. Lie groups	1033
6. Diffeomorphism groups	1039
7. The exponential map and product integrals	1042
8. From Lie algebra to Lie group	1047
9. Non-analyticity of $\text{Diff}(M)$	1051
10. Some homotopy groups of Lie groups	1052
References	1055
<i>Course 11. Topological and global aspects of quantum theory, by C.J. Isham</i>	1059
1. Introduction	1062
1.1. Motivation	1062
1.2. Organization	1063
1.3. Connection between topology and group representation theory	1066
1.4. The course in the light of the covariant/canonical debate	1068
2. The origin of global structure in quantum theory	1069
2.1. Some basic ideas	1069
2.2. Examples of finite-dimensional systems with non-trivial configuration spaces	1072
2.3. The nonlinear σ -model	1077
2.4. Yang-Mills theory	1084
2.5. The canonical quantization of gravity	1088
3. The mathematical structures of classical mechanics	1092
3.1. A quick review of elementary differential geometry	1092
3.2. Classical dynamics and phase space	1099
3.3. The symplectic structure on phase space	1108
3.4. The example of a Lie group	1120
4. Quantization on a general configuration space	1127
4.1. The general ideas of quantization	1127
4.2. A short summary of the general scheme	1137
4.3. The general scheme for quantization	1142
4.4. The example of $Q = \mathbb{R}$	1158
4.5. The example of $Q = \mathbb{R}_+$	1162
4.6. The example of $Q = S^1$	1170

4.7. The general use of the group $C^\infty(Q, \mathbb{R})/\mathbb{R} \otimes \text{Diff } Q$	1176
4.8. The general example of $Q = G/H$	1184
4.9. The example of $Q = S^n$	1194
4.10. Quantum theory on the general linear group $GL^+(n, \mathbb{R})$	1198
5. Topological quantum effects from twisted group representations	1204
5.1. A quick review of some fibre bundle theory	1204
5.2. Twisting representations by lifting the group action	1218
5.3. Cocycles and the comparison of lifts	1229
5.4. θ -states and the lifting to a covering space	1240
5.5. Flat connections and the Bohm–Aharonov phase factor	1246
5.6. Spectral transforms and generalized ‘ n ’-states	1255
5.7. Induced representations and $X = G/H$	1259
5.8. Mackey theory and the representations of semi-direct products	1266
6. Application to the canonical quantization of gravity	1273
References	1286

Course 12. Chiral anomalies and differential geometry, by Bruno Zumino; notes by K. Sibold 1291

1. Introduction	1294
2. Chiral anomalies and differential forms	1297
3. Transformation properties of the anomalies	1303
4. Identification and use of the anomalies	1309
5. Normalization of the anomalies	1315
Appendix I. A simple formula for α_{2n-2}	1319
References	1321
