1 Functions 1

Those properties of functions (or mappings) are established by virtue of which certain sets of functions form groups under composition.

Summary 7

Historical note 8

Answers 9

2 Permutations of a finite set 11

The cycle notation is developed and even and odd permutations are distinguished.

Summary 19

Historical note 19

Answers 20

3 Groups of permutations of \mathbb{R} and \mathbb{C} 23

Every isometry of the plane is shown to be representable as a transformation of \mathbb{C} of the form $z \mapsto e^{i\theta}z + c$ or of the form $z \mapsto e^{i\theta}\bar{z} + c$.

Summary 33

Historical note 33

Answers 35

4 The Möbius group 40

The group of cross-ratio preserving transformations is shown to be the set of transformations of the form

$$z \mapsto \frac{az + b}{cz + d} \text{ where } ad - bc \neq 0.$$

Each such transformation is shown to preserve the set of lines and circles in the plane.

Answers 53

5 The regular solids 57

The groups of rotations of the regular solids are identified with the permutation groups A_4 , S_4 and A_5 .

Summary 60

Historical note 60

Answers 61

6 Abstract groups 62

Groups are defined by four axioms. Some groups are seen to be generated by particular sets of elements. Isomorphism of groups is defined.

Answers 74

7 Inversions of the Möbius plane and stereographic projection 77

Stereographic projection is used to show that the group generated by inversions of the Möbius plane is isomorphic to the group of circle preserving transformations of a sphere.

Summary 84

Historical note 84

Answers 85

8 Equivalence relations 88

The process of classification is given a formal analysis.

Summary 91

Historical note 91

Answers 92

9 Cosets 93

A subgroup is used to partition the elements of a group. Lagrange's theorem for finite groups, that the order of a subgroup divides the order of the group, is obtained. A one-one correspondence is established between the cosets of a stabiliser and the orbit of the point stabilised.

Summary 97

Historical note 98

Answers 99

10 Direct product 101

A simple method of using two given groups to construct one new group is defined.

11 Fields and vector spaces 105

When the elements of an additive group (with identity 0) are also the elements of a multiplicative group (without 0) and the operations are linked by dis-

tributive laws, the set is called a field when the multiplicative group is commutative. When a multiple direct product is formed with the same additive group of a field as each component, and this direct product is supplied with a scalar multiplication from the field, the direct product is called a vector space.

Summary 110

Answers 112

12 Linear transformations 114

When two vector spaces have the same field, a structure preserving function of one to the other can be described with a matrix.

Summary 116

Historical note 117

Answers 118

13 The general linear group $GL(2, F)$ 119

The structure preserving permutations of a 2-dimensional vector space are analysed.

Summary 123

Historical note 124

Answers 126

14 The vector space $V_3(F)$ 128

Scalar and vector products are defined in three dimensions. The meaning and properties of determinants of 3×3 matrices are explored.

Summary 132

Historical note 133

Answers 134

15 Eigenvectors and eigenvalues 136

Vectors mapped onto scalar multiples of themselves under a linear transformation are found and used to construct a diagonal matrix to describe the same transformation, where possible.

Summary 143

Answers 145

16 Homomorphisms 148

Those functions of a group to a group which preserve the multiplicative structure are analysed. The subset of elements mapped to the identity is a normal subgroup. Each coset of that normal subgroup has a singleton image.

Summary 152

Historical note 152

Answers 153

17 Conjugacy 155

When x and g belong to the same group, the elements x and $g^{-1}xg$ are said to be conjugate. Conjugate permutations have the same cycle structure.

Conjugate geometric transformations have the same geometric structure. Normal subgroups are formed from a union of conjugacy classes.

Summary 162

Historical note 162

Answers 163

18 Linear fractional groups 167

The set of transformations of the form

$$x \mapsto \frac{ax + b}{cx + d} \text{ where } ad - bc \neq 0,$$

is a homomorphic image of the group $GL(2, F)$.

Historical note 174

Answers 175

19 Quaternions and rotations 178

Matrices of the form $\begin{pmatrix} z & w \\ -\bar{w} & \bar{z} \end{pmatrix}$, with complex entries, are called quaternions.

The set of quaternions satisfies all the conditions for a field except that multiplication is not commutative. The mapping of quaternions given by $X \mapsto R^{-1}XR$ acts like a rotation on 3-dimensional real spaces.

Summary 182

Historical note 183

Answers 184

20 Affine groups 185

Line and ratio preserving transformations are shown to be combinations of translations and linear transformations.

Summary 188

Historical note 188

Answers 190

21 Orthogonal groups 191

Isometries are shown to be combinations of translations and linear transformations with matrices A such that $A \cdot A^T = I$. Finite groups of rotations in three dimensions are shown to be cyclic, dihedral or the groups of the regular solids.

Summary 199

22 Discrete groups fixing a line 205

If G is a group of isometries and T is its group of translations, the quotient group G/\mathcal{K} is isomorphic to a group of isometries fixing a point, called the point group of G . If G fixes a line, its point group is either C_1 , C_2 , D_1 or D_2 . This provides a basis for identifying the seven groups of this type.

Summary 209

Historical note 210

Answers 211

23 Wallpaper groups 213

Groups of isometries not fixing a point or a line are shown to contain translations. If there are no arbitrarily short translations, the translation group has two generators. If such a group contains rotations, their order may only be 2, 3, 4 or 6. The possible point groups are then C_1 , C_2 , C_3 , C_4 , C_6 , D_1 , D_2 , D_3 , D_4 or D_6 . This provides a basis for classifying the seventeen possible groups of this type.
