Contents

Preface xi

Notation xv

1 Preliminaries 1
§1. Notation and terminology 1
§2. Group algebras 4
§3. Assumed results 9
§4. Morita–equivalent rings 14

2 Some basic topics 17
§5. Direct decompositions of algebras 17
§6. The Cartan matrix 26
§7. Central idempotents of group algebras 29
§8. The Brauer correspondence 33
§9. The number of irreducible FG-modules 39
§10. The principal block 42
§11. The kernel of a block 45
§12. Twisted group algebras 47
§13. Algebras over complete noetherian local rings 55
§14. Modular systems 65
§15. Ordinary and modular representations 72
§16. A characterization of defects of blocks 81
§17. Induced modules 91

3 Group algebras as symmetric algebras 105
§18. Frobenius and symmetric algebras 105
§19. Socle and commutator subspace of Frobenius and symmetric algebras 114
§20. Local symmetric algebras 118

§21. Symmetric algebras over perfect fields 122
§22. Idempotents, sections and central ideals 128
§23. Powers and class sums 134
§24. A characterization of exponents of defect groups of blocks 139
§25. The number of blocks with a given defect group 144
§26. Existence of p-blocks with a given defect group 151

4 Structure theorems 158
§27. Blocks and normal subgroups 158
§28. A decomposition theorem 167
§29. Primary and quasi-primary blocks 173
§30. Quotients, Cartan matrices and Morita-equivalent blocks 180

5 Group–graded algebras and crossed products 192
§31. Group–graded algebras and modules 192
§32. Group actions and related results 205
§33. Crossed products 211
§34. Extending modules over graded algebras 225
§35. A structure theorem for strongly graded algebras 231

6 Structure of blocks with normal defect groups 235
§36. Some results on separable algebras 235
§37. Blocks of crossed products 247
§38. Structure of blocks with normal defect groups 256

7 Blocks and vertices 265
§39. Relative projective and injective modules 265
§40. Vertices and sources 274
§41. The Green correspondence 284
§42. $F(G \times G)$-modules 288
§43. Relations between the Green and Brauer correspondences 291
§44. A characterization of defect groups of blocks 297
§45. An application: Brauer correspondence for covering blocks 304
§46. Another application: criteria for $J(FG) = FG \cdot J(FH)$ 313

8 Structure of blocks of p-solvable groups 322
§47. The Fong correspondence 322
§48. Blocks and factor groups 331
§49. The main theorem 336

§50. Structure of blocks with cyclic, dihedral and generalized quaternion defect groups 343

9 Structure of blocks with extra-special defect groups 346
§51. Preliminary results 346
§52. The case $p > 3$ 356
§53. The case $p = 3$ 359

10 Uniserial blocks 369
§54. Uniserial modules and algebras 369
§55. Periodicity of composition factors 380
§56. Indecomposable modules with cyclic vertex 386
§57. Uniserial blocks and normal subgroups 392
§58. Characterizations of uniserial blocks 398
