

CONTENTS

1	Introduction	1
1.1	Annotated definitions	4
1.1.1	Quantifier hierarchies	5
1.1.2	Mainly concerning type theory	6
1.1.3	Other definitions	9
1.1.4	Theories	10
1.2	Some motivations and axioms	11
1.2.1	Sets as predicates-in-extension	11
1.2.2	Sets as natural kinds	21
1.3	A brief survey	22
1.4	How do theories with $V \in V$ avoid the paradoxes?	24
1.5	Chronology	25
2	<i>NF</i> and related systems	26
2.1	<i>NF</i>	26
2.1.1	The axiom of counting	30
2.1.2	Boffa's lemma on n -formulae, and the automorphism lemma for set abstracts	33
2.1.3	Miscellaneous combinatorics	35
2.1.4	Well-founded sets	40
2.2	Cardinal and ordinal arithmetic	44
2.2.1	Some remarks on inductive definitions	55
2.2.2	Closure properties of small sets	57
2.3	The Kaye–Specker equiconsistency lemma	58
2.3.1	NF_3	65
2.3.2	NFU	67
2.3.3	Lake's model	72
2.3.4	KF	72
2.4	Subsystems, term models, and prefix classes	83
2.5	The converse consistency problem	89
3	Permutation models	92
3.1	Permutations in <i>NF</i>	96
3.1.1	Inner permutations in <i>NF</i>	97
3.1.2	Outer automorphisms in <i>NF</i>	119
3.2	Applications to other theories	121

4	Church–Oswald models	122
4.1	Oswald’s model	122
4.2	Low sets	124
4.2.1	Other definitions of low	125
4.3	\mathcal{P} -extensions and permutation models	126
4.3.1	\mathcal{P} -extensions	126
4.3.2	Hereditarily low sets and permutation models	127
4.3.3	Permutation models of CO structures	129
4.4	Two applications	130
4.4.1	An elementary example	130
4.4.2	\mathcal{P} -extending models of Zermelo to models of <i>NFO</i>	132
4.5	Church’s model	136
4.6	Mitchell’s set theory	139
4.7	Conclusions	140
5	Open problems	143
5.1	Permutation models and quantifier hierarchies	143
5.2	Cardinals and ordinals in <i>NF</i>	144
5.3	KF	144
5.4	Other subsystems	145
5.5	Well-founded extensional relations	145
5.6	Term models	146
5.7	Miscellaneous	146
	Bibliography	148
	Index of definitions	161
	Author index	163
	General index	164
