Preface ix

1. What is Combinatorics? 1

Sample problems — How to use this book — What you need to know — Exercises

2. On numbers and counting 7

Natural numbers and arithmetic — Induction — Some useful functions — Orders of magnitude — Different ways of counting — Double counting — Appendix on set notation — Exercises

3. Subsets, partitions, permutations 21

Subsets — Subsets of fixed size — The Binomial Theorem and Pascal's Triangle — Project: Congruences of binomial coefficients — Permutations — Estimates for factorials — Selections — Equivalence and order — Project: Finite topologies — Project: Cayley's Theorem on trees — Bell numbers — Generating combinatorial objects — Exercises

4. Recurrence relations and generating functions 49

Fibonacci numbers — Aside on formal power series — Linear recurrence relations with constant coefficients — Derangements and involutions — Catalan and Bell numbers — Computing solutions to recurrence relations — Project: Finite fields and QUICKSORT *— Exercises*

5. The Principle of Inclusion and Exclusion 75

PIE — A generalisation — Stirling numbers — Project: Stirling numbers and exponentials — Even and odd permutations — Exercises

6. Latin squares and SDRs 87

Latin squares — Systems of distinct representatives — How many Latin squares? — Quasigroups — Project: Quasigroups and groups — Orthogonal Latin squares — Exercises

7. Extremal set theory 99

Intersecting families — Sperner families — The De Bruijn–Erdős Theorem — Project: Regular families — Exercises

8. Steiner triple systems 107

Steiner systems — A direct construction — A recursive construction — Packing and covering — Project: Some special Steiner triple systems — Project: Tournaments and Kirkman's schoolgirls — Exercises

9. Finite geometry 123

Linear algebra over finite fields — Gaussian coefficients — Projective geometry — Axioms for projective geometry — Projective planes — Other kinds of geometry — Project: Coordinates and configurations — Project: Proof of the Bruck–Ryser Theorem — Appendix: Finite fields — Exercises

10. Ramsey's Theorem 147

The Pigeonhole Principle — Some special cases — Ramsey's Theorem — Bounds for Ramsey numbers — Applications — The infinite version — Exercises

11. Graphs 159

Definitions — Trees and forests — Minimal spanning trees — Eulerian graphs — Hamiltonian graphs — Project: Gray codes — The Travelling Salesman — Digraphs — Networks — Menger, König and Hall — Diameter and girth — Project: Moore graphs — Exercises

12. Posets, lattices and matroids 187

Posets and lattices — Linear extensions of a poset — Distributive lattices — Aside on propositional logic — Chains and antichains — Products and dimension — The Möbius function of a poset — Matroids — Project: Arrow's Theorem — Exercises

13. More on partitions and permutations 209

Partitions, diagrams and conjugacy classes — Euler's Pentagonal Numbers Theorem — Project: Jacobi's Identity — Tableaux — Symmetric polynomials — Exercises

14. Automorphism groups and permutation groups 225

Three definitions of a group — Examples of groups — Orbits and transitivity — The Schreier–Sims algorithm — Primitivity and multiple transitivity — Examples — Project: Cayley digraphs and Frucht's Theorem — Exercises

15. Enumeration under group action 245

The Orbit-counting Lemma — An application — Cycle index — Examples — Direct and wreath products — Stirling numbers revisited — Project: Cycle index and symmetric functions — Exercises

16. Designs 257

Definitions and examples — To repeat or not to repeat — Fisher's Inequality — Designs from finite geometry — Small designs — Project: Hadamard matrices — Exercises

17. Error-correcting codes 271

Finding out a liar — Definitions — Probabilistic considerations — Some bounds — Linear codes; Hamming codes — Perfect codes — Linear codes and projective spaces — Exercises

18. Graph colourings 291

More on bipartite graphs — Vertex colourings — Project: Brooks' Theorem — Perfect graphs — Edge colourings — Topological graph theory — Project: The Five-colour Theorem — Exercises

19. The infinite 307

Counting infinite sets — König's Infinity Lemma — Posets and Zorn's Lemma — Ramsey theory — Systems of distinct representatives — Free constructions — The random graph — Exercises

20. Where to from here? 325

Computational complexity — Some graph-theoretic topics — Computer software — Unsolved problems — Further reading

Answers to selected exercises 339

Bibliography 343
