Preface	v
--------------------------	---

PART I RINGS AND MODULES

1. Rings – definitions and examples

1. The definition of a ring	3
2. Some examples of rings	5
3. Some special classes of rings	11

2. Subrings, homomorphisms and ideals

1. Subrings	15
2. Homomorphisms	18
3. Some properties of subrings and ideals	26

3. Construction of new rings

1. Direct sums	33
2. Polynomial rings	37
3. Matrix rings	44

4. Factorization in integral domains

1. Integral domains	49
2. Divisors, units and associates	51
3. Unique factorization domains	54
4. Principal ideal domains and Euclidean domains	59
5. More about Euclidean domains	62

5. Modules

1. The definition of a module over a ring	69
2. Submodules	74
3. Homomorphisms and quotient modules	77
4. Direct sums of modules	80

6. Some special classes of modules

1. More on finitely-generated modules	85
2. Torsion modules	87
3. Free modules	89

**PART II DIRECT DECOMPOSITION OF A
FINITELY-GENERATED MODULE
OVER A PRINCIPAL IDEAL DOMAIN**

7. Submodules of free modules

1. The programme	99
2. Free modules – bases, endomorphisms and matrices .	100
3. A matrix formulation of Theorem 7.1	106
4. Elementary row and column operations	110
5. Proof of 7.10 for Euclidean domains	111
6. The general case	114
7. Invariant factors	115
8. Summary and a worked example	118

8. Decomposition theorems

1. The main theorem	123
2. Uniqueness of the decomposition	127
3. The primary decomposition of a module	132

9. Decomposition theorems – a matrix-free approach

1. Existence of the decompositions	139
2. Uniqueness – a cancellation property of FG modules	143

**PART III APPLICATIONS TO GROUPS
AND MATRICES**

10. Finitely-generated Abelian groups

1. \mathbb{Z} -modules	151
2. Classification of finitely-generated Abelian groups .	152
3. Finite Abelian groups	154
4. Generators and relations	157
5. Computing invariants from presentations	160

11. Linear transformations, matrices and canonical forms

1. Matrices and linear transformations	167
2. Invariant subspaces	169
3. V as a $\mathbf{k}[x]$ -module	170
4. Matrices for cyclic linear transformations	176
5. Canonical forms	179
6. Minimal and characteristic polynomials	184

12. Computation of canonical forms

1. The module formulation	193
2. The kernel of ϵ	195
3. The rational canonical form	197
4. The primary rational and Jordan canonical forms	200
