FOREWORD	v
SYMBOLS AND CONVENTIONS	xi

I. Vectors and Matrices

1. Vectors	1
2. Addition of Vectors and Scalar Multiplication	5
3. Linear Vector Spaces	7
4. Dimensionality and Bases	8
5. Linear Homogeneous Systems—Matrices	10
6. Partitioned Matrices	15
7. Addition of Matrices and Scalar Multiplication	16
8. Multiplication of a Matrix Times a Vector	17
9. Matrix Multiplication	19
10. An Algebra	22
11. Commutativity	23
12. Divisors of Zero	25
13. A Matrix as a Representation of an Abstract Operator	26
14. Other Product Relations	27
15. The Inverse of a Matrix	29
16. Rank of a Matrix	31
17. Gauss's Algorithm	32
18. 2-Port Networks	35
19. Example	37

II. The Inner Product

1. Unitary Inner Product	43
2. Alternative Representation of Unitary Inner Product	48
3. General (Proper) Inner Product	49
4. Euclidean Inner Product	51
5. Skew Axes	53
6. Orthogonality	56
7. Normalization	58
8. Gram-Schmidt Process	59
9. The Norm of a Vector	61

III. Eigenvalues and Eigenvectors

1. Basic Concept	66
2. Characteristic or Iterative Impedance	69
3. Formal Development	70
4. Determination of the Eigenvalues	72
5. Singularity	73

6. Linear Independence	74
7. Semisimplicity	76
8. Nonsemisimple Matrices	76
9. Degeneracy in a Chain	78
10. Examples	79
11. π -Section of a Filter	81
12. Structure of the Characteristic Equation	83
13. Rank of a Matrix	85
14. The Trace of a Matrix	86
15. Reciprocal Vectors	87
16. Reciprocal Eigenvectors	88
17. Reciprocal Generalized Eigenvectors	89
18. Variational Description of the Eigenvectors and Eigenvalues	91

IV. Hermitian, Unitary, and Normal Matrices

1. Adjoint Relation	97
2. Rule of Combination	99
3. The Basic Types	100
4. Decomposition into Hermitian Components	102
5. Polar Decomposition	102
6. Structure of Normal Matrices	103
7. The Converse Theorem	107
8. Hermitian Matrices	109
9. Unitary Matrices	110
10. General (Proper) Inner Product	110

V. Change of Basis, Diagonalization, and the Jordan Canonical Form

1. Change of Basis and Similarity Transformations	115
2. Equivalence Transformations	117
3. Congruent and Conjunctive Transformations	118
4. Example	119
5. Gauge Invariance	121
6. Invariance of the Eigenvalues under a Change of Basis	121
7. Invariance of the Trace	122
8. Variation of the Eigenvalues under a Conjunctive Transformation	123
9. Diagonalization	124
10. Diagonalization of Normal Matrices	126
11. Conjunctive Transformation of a Hermitian Matrix	127
12. Example	128
13. Positive Definite Hermitian Forms	130
14. Lagrange's Method	131
15. Canonical Form of a Nonsemisimple Matrix	133
16. Example	135
17. Powers and Polynomials of a Matrix	137
18. The Cayley-Hamilton Theorem	141
19. The Minimum Polynomial	142

20. Examples	143
21. Summary	144

VI. Functions of a Matrix

1. Differential Equations	147
2. Reduction of Degree	149
3. Series Expansion	150
4. Transmission Line	152
5. Square Root Function	153
6. Unitary Matrices as Exponentials	155
7. Eigenvectors	155
8. Spectrum of a Matrix	157
9. Example	159
10. Commutativity	160
11. Functional Relations	162
12. Derivative of $e^{-\mathbf{R}t}$, \mathbf{R} Constant	165
13. \mathbf{R} Not Constant	165
14. Derivative of a Power	166
15. Example	168

VII. The Matricant

1. Integral Matrix	172
2. The Matricant	174
3. Matricants of Related Systems	176
4. Peano Expansion	177
5. Error of Approximation	182
6. Bound on the Difference	183
7. Approximate Expansion	186
8. Inhomogeneous Equations	187
9. The Multiplicative Integral of Volterra	188

VII. Decomposition Theorems and the Jordan Canonical Form

1. Decomposition	193
2. Decomposition into Eigensubspaces	196
3. Congruence and Factor Space	200
4. Cyclic Subspaces	203
5. Decomposition into Cyclic Subspaces	204
6. The Jordan Canonical Form	208
7. Invariant Polynomials and Elementary Divisors	211
8. Conclusions	213

IX. The Improper Inner Product

1. The Improper Inner Product	217
2. Failure of Cauchy-Schwartz and Triangle Inequalities	218

3. Orthogonal Sets of Vectors	219
4. Pairwise Orthogonality	220
5. Adjoint Operator	223
6. Orthogonality and Normality	225
7. K -Hermitian Matrices	227
8. K -Unitary Matrices	230
9. Orthogonalization of a Set of Vectors	232
10. Range of K	233
11. Determination of a Metric	235

X. The Dyad Expansion and Its Application

1. The Outer Product of Two Vectors	239
2. K -Dyads	240
3. Idempotency and Nilpotency	241
4. Expansion of an Arbitrary Matrix	242
5. Functions of a Matrix	244
6. Example	244
7. Differential Equations with Constant Coefficients	245
8. Perturbation Theory, Nondegenerate Case	247
9. Degenerate Case	250
10. Approximate Matricant	252
11. Conclusion	253

XI. Projectors

1, Definition of a Projector	258
2. Idempotency	260
3. Combinations of Projectors	262
4. Invariant Subspaces	266
5. Eigensubspaces	267
6. Semisimple Matrices	268
7. Nonsemisimple Matrices	270
8. Determination of P_i , A Semisimple	271
9. A Not Semisimple	272
10. The Resolvent	273
11. Orthogonality	274
12. Conclusions	276

XII. Singular and Rectangular Operators

1. Abstract Formulation	280
2. Semisimple T	282
3. Example	284
4. Not Semisimple	286
5. Example	289
6. Conclusions	290

XIII. The Commutator Operator

1. Lie Groups	295
2. Infinitesimal Transformations of a Lie Group	297
3. Role of the Commutator	299
4. Lie Algebras	300
5. The Product Relation	301
6. K -Skew-Hermitian Algebra	303
7. The Ad Operator	304
8. Linearity	306
9. Eigenvalues and Eigenvectors	307
10. The Equation $\mathbf{U} = \text{Ad}_A \mathbf{V}$	310
11. The Killing Form	312
12. The Exponential of Ad_S	313
13. Simple Nonuniformity	314
14. The Exponentially Tapered Transmission Line	316
15. Conclusions	317

XIV. The Direct Product and the Kronecker Sum

1. The Direct Product	321
2. Justification of "Product"	323
3. The Product of Matricants and the Kronecker Sum	324
4. Group Theoretic Significance	325
5. Exponentiation	326
6. Eigenvectors and Eigenvalues of the Direct Product	328
7. Eigenvectors and Eigenvalues of the Kronecker Sum	329
8. Necessary Condition	329
9. Mixed Inverses	331
10. Summary	332

XV. Periodic Systems

1. Reducibility in the Sense of Lyapunov	335
2. Periodic Systems	336
3. Form of the Floquet Factors	338
4. Determination from the Matricant	339
5. The Floquet Modes	339
6. Space Harmonics	340
7. Orthogonality Relations	341
8. Example	343
9. Conclusions	346

XVI. Application to Electromagnetic Theory

1. Cartesian System	348
2. Maxwell's Equations	350
3. Magnetic Hertzian Vector Potential	351
4. Electric Hertzian Vector Potential	352

5. Change of Basis	353
6. Polarization Coordinates	355
7. Conclusions	357

XVII. Sturm-Liouville Systems

1. Approximation in a Finitely Dimensioned Vector Space	360
2. Modified Sturm-Liouville Equation	363
3. The Characteristic Equation of H	365
4. Sturm Chains	366
5. Recursion Formula	368

XVIII. Markoff Matrices and Probability Theory

1. State Vector	373
2. Transition or Markoff Matrix	374
3. Eigenvectors of a Markoff Matrix	376
4. Reciprocal Eigenvectors	378
5. Nonnegative and Positive Matrices	379
6. Conclusions	381

XIX. Stability

1. The Basic Theorem for Stability	384
2. Routh-Hurwitz Method	386
3. Hurwitz Determinants	389
4. Criterion of Lienard and Chipart	389
5. Lyapunov's Second Method	390
6. A Metric as Lyapunov Matrix	393
7. Conclusions	394
