INTRODUCTION.

	Page
<i>The fundamental theorems of Lie's theory of continuous groups</i>	1

CHAPTER I.

<i>Transformation of systems of linear homogeneous differential equations</i>	6
---	---

CHAPTER II.

Invariants of the linear homogeneous differential equation of the n^{th} order.

§ 1. Fundamental notions	14
§ 2. Seminvariants and semi-covariants	15
§ 3. Invariants and covariants. Fundamental properties	18
§ 4. Canonical form of the differential equation and of its invariants	24
§ 5. The Lagrange adjoint equation	40
§ 6. Geometrical interpretation.	47
§ 7. The relation of the invariants of a linear differential equation to Halphen's differential invariants	56
Examples	57

CHAPTER III.

Projective differential geometry of plane curves.

§ 1. The invariants and covariants for $n = 3$	58
§ 2. The equations of the osculating conic and cubic	61
§ 3. Geometrical interpretation of the semi-covariants	64
§ 4. The eight-pointic cubics, the Halphen point, coincidence points	67
§ 5. The curves, all of whose points are coincidence points	69
§ 6. Curves of the third order	72
§ 7. Canonical development for the equation of a plane curve in non-homogeneous coordinates	82
§ 8. Anharmonic curves	86
§ 9. Discussion of the special case $\Theta_3 = 0$	90
Examples	91

CHAPTER IV.

	Page
<i>Invariants and covariants of systems of linear differential equations.</i>	
§ 1. Finite transformations of the dependent variables	91
§ 2. Infinitesimal transformations of the dependent variables	94
§ 3. Calculation of the seminvariants for $m = n = 2$	95
§ 4. Effect of a transformation of the independent variable upon the seminvariants	103
§ 5. Calculation of some of the invariants. Their general properties . .	106
§ 6. Canonical forms of a system of two linear differential equations of the second order	114
§ 7. The complete system of invariants	118
§ 8. The covariants	122
Examples	126

CHAPTER V.

Foundations of the theory of ruled surfaces.

§ 1. Definition of the general solutions, and of a fundamental system of solutions of a simultaneous system of two linear homogeneous differential equations of the second order	126
§ 2. Geometrical interpretation. The integrating ruled surface of (A) . .	129
§ 3. Dualistic interpretation. The adjoint system of (A)	134
§ 4. Properties of adjoined systems. Reciprocity	138
§ 5. The fundamental theorem of the theory of ruled surfaces	143
Examples	145

CHAPTER VI.

Significance of the covariants P and C .

§ 1. The flecnode curve and the flecnode surface	146
Examples	153

CHAPTER VII.

Elements of line geometry.

§ 1. Line-coordinates, complexes, congruences, ruled surfaces	154
§ 2. The linear complex. Null-system	159
§ 3. The linear congruence	162

CHAPTER VIII.

The equation of the ruled surface in line-coordinates.

§ 1. The differential equation for the line-coordinates	165
§ 2. Conditions for a ruled surface whose generators belong to a linear complex or a linear congruence	167
§ 3. A function-theoretic application	173
Examples	174

CHAPTER IX.

The flecnode congruence.

	Page
§ 1. The developables of the congruence and its focal surface	175
§ 2. Correspondence between the curves on a ruled surface and on its derivative	184
Examples	190

CHAPTER X.

The flecnode congruence (continued).

§ 1. The derivative cubic curve	191
§ 2. Null-system of the derivative cubic	202
§ 3. The osculating linear complex	204
§ 4. Relation of the osculating linear complex to the linear complex of the derivative cubic	209
§ 5. Various theorems concerning the flecnode surface. The principal surface of the congruence	213
§ 6. The covariant C_3 for $\Theta_4 \neq 0$	218
Examples	220

CHAPTER XI.

Ruled surfaces whose flecnode curve intersects every generator in two coincident points.

§ 1. The covariant C_3	221
§ 2. The derivative conic	223
§ 3. The developable surface generated by the plane of the derivative conic	225
Examples	229

CHAPTER XII.

General theory of curves on ruled surfaces.

§ 1. Relation between the differential equations of the surface and of the curves situated upon it	229
§ 2. On ruled surfaces, one of the branches of whose flecnode curve is given	231
§ 3. On ruled surfaces, one of the branches of whose complex curve is given	236
Examples	237

CHAPTER XIII.

Projective differential geometry of space curves.

§ 1. The invariants and covariants for $n = 4$	238
§ 2. Canonical forms	241
§ 3. Geometrical interpretation	243
§ 4. The osculating cubic, conic and linear complex	249
§ 5. Geometrical definition of the fundamental tetrahedron of reference	255

	Page
§ 6. Some further properties of the derived ruled surfaces of the second and third kind	261
§ 7. The principal tangent plane of two space curves. The covariants. Transition to Halphen's investigations	267
Examples	272

CHAPTER XIV.

Projective differential geometry of space curves (continued).

§ 1. Introduction of Halphen's differential invariants and identification with the invariants of the preceding chapter	273
§ 2. The osculating quadric surface	278
§ 3. Anharmonic curves	279
§ 4. Relation to the theory of plane curves	285
§ 5. Some applications to the theory of ruled surfaces	288
§ 6. On the order of contact between curves after a dualistic transformation	290
Examples	294
<i>Index</i>	296
