0. Introduction	1
I. Some History (Lecture 1).	3
A. Actions modeled on 1_{ρ_n}	3
1. The example of Montgomery and Samelson	3
2. Wu-yi Hsiang's thesis	4
B. Actions modeled on 2_{ρ_n}	11
1. Bredon's examples	11
2. The classification theorem of the Hsiangs and Jänich for actions with two types of orbits	12
3. Knot manifolds	13
4. $U(n)$ and $Sp(n)$ knot manifolds	15
References	16
II. Some Preliminary Facts Concerning the Linear Model and Its Orbit Space (Lecture 2).	18
A. The linear representation k_{ρ_n}	18
B. The orbit space of $M(n,k)$	20
III. The Normal Bundles of the Strata and Twist Invariants	24
A. The equivariant normal bundle of a stratum	24
B. The mysterious "twist invariants"	25
C. The classification of biaxial actions without fixed points	29
D. Remarks concerning the general classification theorem	31
References	32
IV. A Structure Theorem for Multiaxial Actions and Some of its Consequences (Lecture 3).	34
A. The Structure Theorem	34

1. The twist invariants of the linear model	34
2. Stratified maps	41
3. The Main Theorem	41
B. The pullback construction and the Covering Homotopy Theorem	46
C. A Classification Theorem	50
D. Applications to knot manifolds and other biaxial actions	52
E. Applications to triaxial actions without fixed points	56
F. Some counterexamples	60
G. Further classification theorems	63
References	64
V. Actions on Spheres (Lecture 4).	66
A. The homology of the strata	67
1. The $U(n)$ and $Sp(n)$ cases	67
2. The $O(n)$ case	69
B. An application of Borel's formula	73
C. The bundle of principal orbits of a k -axial action on a sphere is trivial, if $n \geq k$.	76
References	84
VI. Concordance Classes of Actions on Spheres (Lecture 5).	85
A. The plan of attack	87
B. Multiaxial actions bound	90
C. The calculation of $\theta^d(k, n, m)$	96
References	102
Appendix 1: Biaxial actions of $SO(3)$, G_2 and $SU(3)$ on homotopy spheres	103
References	116
Appendix 2: The homology of the strata in the $O(n)$ case	117
