CHAPTER I

Topological Spaces and Metric Spaces

Introduction	1
I. Topology of the Line \mathbf{R}	2
1. Open Sets, Closed Sets, Neighborhoods, Bounds of a Set	2
2. Limit of a Sequence. The Cauchy Criterion for Convergence	6
3. Compactness of Closed Bounded Intervals	8
4. Topology of the Space \mathbf{R}^n	9
II. Topological Spaces	11
5. Open Sets, Closed Sets, Neighborhoods	11
6. Closure, Interior, Boundary	14
7. Continuous Functions. Homeomorphisms	18
8. Notion of a Limit	23
9. Subspaces of a Topological Space	27
10. Finite Products of Spaces	30
11. Compact Spaces	34
12. Locally Compact Spaces; Compactification	41
13. Connectivity	45
14. Topological Groups, Rings, and Fields	51
III. Metric Spaces	60
15. Metrics and Ecartes	60
16. Topology of a Metric Space	67
17. Uniform Continuity	71
18. Compact Metric Spaces	75
19. Connected Metric Spaces	78
20. Cauchy Sequences and Complete Spaces	80
21. Idea of the Method of Successive Approximations	86
22. Pointwise Convergence and Uniform Convergence	89
23. Equicontinuous Spaces of Functions	98
24. Total Variation and Length	102

Problems	110
The Line \mathbf{R} and the Space \mathbf{R}^n	110
Topological Spaces	111
Metric Spaces	116
DEFINITIONS AND AXIOMS	125
REVIEW OF SOME CLASSICAL NOTATION	126
BIBLIOGRAPHY	126

CHAPTER II

Numerical Functions

I. Numerical Functions Defined on an Arbitrary Set	127
1. Order Relation on $\mathcal{F}(E, \mathbf{R})$ and on $\mathcal{F}(E, \overline{\mathbf{R}})$	127
2. Bounds of a Numerical Function	128
3. Upper and Lower Envelopes of a Family of Functions	129
II. Limit Notions Associated with Numerical Functions	131
4. Limits Superior and Inferior of a Function along a Filter Base on E	132
5. Limits Superior and Inferior of a Family of Functions	134
6. Operations on Continuous Functions	135
III. Semicontinuous Numerical Functions	136
7. Semicontinuity at a Point	137
8. Functions, Lower Semicontinuous on the Entire Space	138
9. Construction of Lower Semicontinuous Functions	141
10. Semicontinuous Functions on a Compact Space	141
11. Semicontinuity of Length	142
IV. The Stone-Weierstrass Theorem (Section 12)	146
V. Functions Defined on an Interval of \mathbf{R}	150
13. Left and Right Limits	151
14. Monotone Functions	153
15. Theorems of Finite Increase	154
16. Definition of Convex Functions. Immediate Properties	157
17. Continuity and Differentiability of Convex Functions	159
18. Criteria for Convexity	161
19. Convex Functions on a Subset of a Vector Space	163
20. The Mean Relative to a Monotone Function	166

Problems	173
Numerical Functions Defined on an Arbitrary Set	173
Numerical Functions Defined on a Topological Space	174
Semicontinuous Numerical Functions	174
Stone-Weierstrass Theorem	175
Theorems of Finite Increase	176
Convex Functions.	176
Means and Inequalities	179
DEFINITIONS AND AXIOMS	181
BIBLIOGRAPHY.	182

CHAPTER III

Topological Vector Spaces

I. General Topological Vector Spaces. Examples	183
1. Definition and Elementary Properties of Topological Vector Spaces	183
2. Topology Associated with a Family of Seminorms	187
3. Classical Examples of Topological Vector Spaces	196
II. Normed Spaces	206
4. Topology Associated with a Norm; Continuous Linear Mappings	202
5. Stability of Isomorphisms	209
6. Product of Normed Spaces; Continuous Multilinear Mappings	212
7. Finite-Dimensional Normed Spaces	214
III. Summable Families; Series; Infinite Products; Normed Algebras	216
8. Summable Families of Real Numbers	216
9. Summable Families in Topological Groups and Normed Spaces	224
10. Series; Comparison of Series and Summable Families	232
11. Series and Summable Families of Functions	239
12. Multipliable Families and Infinite Products of Complex Numbers	243
13. Normed Algebras	251
IV. Hilbert Spaces	259
14. Definition and Elementary Properties of Prehilbert Spaces	260
15. Orthogonal Projection. Study of the Dual.	268
16. Orthogonal Systems	275
17. Fourier Series and Orthogonal Polynomials	282
Problems	287
General Topological Vector Spaces	287
Topology Associated with a Family of Seminorms	289

Topology Associated with a Norm	292
Comparison of Norms	293
Norms and Convex Functions	294
Linear Functionals on Normed Spaces	296
Topological Dual and Bidual	297
Compact Linear Mappings	298
Complete Normed Spaces	300
Separable Normed Spaces	302
Discontinuous Linear Mappings	303
Products of Normed Spaces and Direct Sums	304
Finite-Dimensional Normed Spaces	304
Summable Families of Real or Complex Numbers	305
Summable Families in Topological Groups and Normed Spaces	306
Series; Comparison of Series and Summable Families	308
Summable Series and Families of Functions	310
Multipliable Families and Infinite Products of Complex Numbers	314
Normed Algebras	316
Elementary Properties of Prehilbert Spaces	317
Orthogonal Projection. Study of the Dual.	321
Orthogonal Systems	326
Orthogonal Polynomials	329
DEFINITIONS AND AXIOMS	331
NOTATION	333
BIBLIOGRAPHY.	334
SUBJECT INDEX	335
