CONTENTS

I. THE HISTORICAL DEVELOPMENT OF NON-EUCLIDEAN GEOMETRY

SECTION		PAGE
1.1	Euclid	1
1.2	Saccheri and Lambert	5
1.3	Gauss, Wachter, Schweikart, Taurinus	7
1.4	Lobatschewsky	8
1.5	Bolyai	10
1.6	Riemann	11
1.7	Klein	13

II. REAL PROJECTIVE GEOMETRY: FOUNDATIONS

2.1	Definitions and axioms	16
2.2	Models	23
2.3	The principle of duality	26
2.4	Harmonic sets	28
2.5	Sense	31
2.6	Triangular and tetrahedral regions	34
2.7	Ordered correspondences	35
2.8	One-dimensional projectivities	40
2.9	Involutions	44

III. REAL PROJECTIVE GEOMETRY: POLARITIES, CONICS AND QUADRICS

3.1	Two-dimensional projectivities	48
3.2	Polarities in the plane	52
3.3	Conics	55
3.4	Projectivities on a conic	59
3.5	The fixed points of a collineation	61
3.6	Cones and reguli	62
3.7	Three-dimensional projectivities	63
3.8	Polarities in space	65

IV. HOMOGENEOUS COORDINATES

SECTION		PAGE
4.1	The von Staudt-Hessenberg calculus of points	71
4.2	One-dimensional projectivities	74
4.3	Coordinates in one and two dimensions	76
4.4	Collineations and coordinate transformations	81
4.5	Polarities	85
4.6	Coordinates in three dimensions	87
4.7	Three-dimensional projectivities	90
4.8	Line coordinates for the generators of a quadric	93
4.9	Complex projective geometry	94

V. ELLIPTIC GEOMETRY IN ONE DIMENSION

5.1	Elliptic geometry in general	95
5.2	Models	96
5.3	Reflections and translations	97
5.4	Congruence	100
5.5	Continuous translation	101
5.6	The length of a segment	103
5.7	Distance in terms of cross ratio	104
5.8	Alternative treatment using the complex line	106

VI. ELLIPTIC GEOMETRY IN TWO DIMENSIONS

6.1	Spherical and elliptic geometry	109
6.2	Reflection	110
6.3	Rotations and angles	111
6.4	Congruence	113
6.5	Circles	115
6.6	Composition of rotations	118
6.7	Formulae for distance and angle	120
6.8	Rotations and quaternions	122
6.9	Alternative treatment using the complex plane	126

VII. ELLIPTIC GEOMETRY IN THREE DIMENSIONS

SECTION		PAGE
7.1	Congruent transformations	128
7.2	Clifford parallels	133
7.3	The Stephanos-Cartan representation of rotations by points	136
7.4	Right translations and left translations	138
7.5	Right parallels and left parallels	141
7.6	Study's representation of lines by pairs of points	146
7.7	Clifford translations and quaternions	148
7.8	Study's coordinates for a line	151
7.9	Complex space	153

VIII. DESCRIPTIVE GEOMETRY

8.1	Klein's projective model for hyperbolic geometry	157
8.2	Geometry in a convex region	159
8.3	Veblen's axioms of order	161
8.4	Order in a pencil	162
8.5	The geometry of lines and planes through a fixed point	164
8.6	Generalized bundles and pencils	165
8.7	Ideal points and lines	171
8.8	Verifying the projective axioms	172
8.9	Parallelism	174

IX. EUCLIDEAN AND HYPERBOLIC GEOMETRY

9.1	The introduction of congruence	179
9.2	Perpendicular lines and planes	181
9.3	Improper bundles and pencils	184
9.4	The absolute polarity	185
9.5	The Euclidean case	186
9.6	The hyperbolic case	187
9.7	The Absolute	192
9.8	The geometry of a bundle	197

X. HYPERBOLIC GEOMETRY IN TWO DIMENSIONS

SECTION		PAGE
10.1	Ideal elements	199
10.2	Angle-bisectors	200
10.3	Congruent transformations	201
10.4	Some famous constructions	204
10.5	An alternative expression for distance	206
10.6	The angle of parallelism	207
10.7	Distance and angle in terms of poles and polars	208
10.8	Canonical coordinates	209
10.9	Euclidean geometry as a limiting case	211

XI. CIRCLES AND TRIANGLES

11.1	Various definitions for a circle	213
11.2	The circle as a special conic	215
11.3	Spheres	218
11.4	The in- and ex-circles of a triangle	220
11.5	The circum-circles and centroids	221
11.6	The polar triangle and the orthocentre	223

XII. THE USE OF A GENERAL TRIANGLE OF REFERENCE

12.1	Formulae for distance and angle	224
12.2	The general circle	226
12.3	Tangential equations	228
12.4	Circum-circles and centroids	229
12.5	In- and ex-circles	231
12.6	The orthocentre	231
12.7	Elliptic trigonometry	232
12.8	The radii	235
12.9	Hyperbolic trigonometry	237

XIII. AREA

13.1	Equivalent regions	241
13.2	The choice of a unit	241
13.3	The area of a triangle in elliptic geometry	242
13.4	Area in hyperbolic geometry	243

SECTION PAGE
13.5 The extension to three dimensions 247
13.6 The differential of distance 248
13.7 Arcs and areas of circles 249
13.8 Two surfaces which can be developed on the Euclidean plane 251

XIV. EUCLIDEAN MODELS

14.1 The meaning of "elliptic" and "hyperbolic" 252
14.2 Beltrami's model 252
14.3 The differential of distance 254
14.4 Gnomonic projection 255
14.5 Development on surfaces of constant curvature 256
14.6 Klein's conformal model of the elliptic plane 258
14.7 Klein's conformal model of the hyperbolic plane 260
14.8 Poincaré's model of the hyperbolic plane 263
14.9 Conformal models of non-Euclidean space 264

XV. CONCLUDING REMARKS

15.1 Hjelmslev's mid-line 267
15.2 The Napier chain 273
15.3 The Engel chain 277
15.4 Normalized canonical coordinates 281
15.5 Curvature 283
15.6 Quadratic forms 284
15.7 The volume of a tetrahedron 285
15.8 A brief historical survey of construction problems 289

BIBLIOGRAPHY 293
