

Contents

Notation	xi
1. Introduction	1
1.1 Fractional parts of a polynomial	1
1.2 Vinogradov's methods	4
1.3 Simultaneous approximations	5
1.4 Functions of many variables	6
1.5 Forms of odd degree	8
1.6 Forms of even degree	9
2. Fourier analysis	12
2.1 Vinogradov's auxiliary function	12
2.2 Construction of trigonometric polynomials	14
2.3 Lower bounds for trigonometric sums	19
3. Heilbronn's theorem and Schmidt's extension	22
3.1 The basic technique	22
3.2 Lemmas on reciprocal sums	24
3.3 Schmidt's extension of Heilbronn's theorem	28
3.4 A simultaneous approximation result	30
3.5 Weyl's inequality	34
4. Vinogradov's mean value method	38
4.1 Approximation to the coefficients $\alpha_2, \dots, \alpha_k$	38
4.2 The final coefficient lemma	42
4.3 Application to fractional parts	46
5. The solution of Davenport's problem	49
5.1 More about difference operators	49
5.2 Finding out about one more coefficient	51
5.3 Small values of $f(n)$ modulo one	58
6. The method of sums of kth powers	60
6.1 Counting solutions of an equation	60
6.2 A theorem about an^k	65
6.3 Conclusion	68

7. Schmidt's lattice method	69
7.1 Introduction	69
7.2 Successive minima	71
7.3 An auxiliary function	72
7.4 Rational approximation to inner products	75
7.5 A determinant argument	77
7.6 Lattices in subspaces	81
7.7 Proof of Theorem 7.2	84
8. The lattice method for polynomials of arbitrary degree	88
8.1 An inductive strategy	88
8.2 Lemmas on exponential sums	90
8.3 An alternative lemma	93
8.4 Proof of Theorem 8.2	97
8.5 More about exponential sums: monomials	100
9. Quadratic forms	106
9.1 Self-adjoint linear forms	106
9.2 Danicic's theorem	109
9.3 Small solutions of quadratic congruences	111
9.4 Fractional parts of quadratic forms again	122
10. Simultaneous approximation for quadratic forms and additive forms	127
10.1 Introduction	127
10.2 Proof of Theorem 10.2	128
10.3 Application to a set of quadratic forms	133
11. Nonnegative solutions of additive equations	136
11.1 A direct application of the circle method	136
11.2 An inductive argument	143
11.3 Two cases	144
11.4 The circle method again	147
11.5 The major arcs	149
11.6 The singular integral and the singular series	151
12. Small solutions of additive congruences	153
12.1 An inductive assertion	153
12.2 Division into two cases	156
12.3 Application of a 'discrete' circle method	161
13. Small solutions of additive equations of odd degree	164
13.1 Preliminary reductions	164
13.2 The circle method	167
13.3 The minor arcs: a further analysis	169
13.4 The major arcs	172
13.5 Conclusion	173

14. Diophantine inequalities for forms of odd degree	175
14.1 Multilinear forms	175
14.2 Additive forms	178
14.3 The Davenport–Heilbronn circle method	180
14.4 An induction on the degree	186
14.5 The case of a single form	189
14.6 Conclusion	194
15. Exponential sums: forms with integer coefficients	195
15.1 Introduction	195
15.2 Algebraic geometry	199
15.3 Manifolds \mathcal{M} , and invariants g	200
15.4 Weyl’s inequality	202
15.5 Predominantly linear exponential sums	206
15.6 Exponential sums and multilinear inequalities	209
15.7 An application of the geometry of numbers	211
15.8 Systems of forms	215
16. The invariants g and h	219
16.1 Invariants $g_{\mathbb{C}}$ and $h_{\mathbb{C}}$	219
16.2 The arithmetical case	221
16.3 Simple points	222
16.4 Higher derivatives	224
16.5 Operators \mathcal{D}_r	225
16.6 Proof of Proposition 16.1: beginning	226
16.7 Completion of the proof of Proposition 16.1	229
16.8 Proof of Proposition 16.2	233
17. Exponential sums: polynomials on a finite group	237
17.1 Introduction	237
17.2 Weyl’s inequality for groups	241
17.3 \mathcal{M} and incomplete sums	244
17.4 Invariants h, \bar{h}, g	246
17.5 Proof of Theorems 17.1 and 17.2	249
17.6 Proof of Theorem 17.3	250
17.7 Proof of Theorem 17.4	251
17.8 The invariants h_a	252
18. Small solutions of congruences to general modulus	256
18.1 Introduction	256
18.2 Estimation of exponential sums	258
18.3 Proof of Proposition 18.1	259
18.4 An inductive argument	262
