Chapter 1. An Introduction to the Homotopy Groups of Spheres

1. Classical Theorems Old and New	3
-----------------------------------	---

Homotopy groups. The Hurewicz and Freudenthal theorems. Stable stems. The Hopf map. Serre's finiteness theorem. Nishida's nilpotence theorem. Cohen, Moore, and Neisendorfer's exponent theorem. Bott periodicity. The J -homomorphism.

2. Methods of Computing $\pi(S^n)$	7
------------------------------------	---

Eilenberg–Mac Lane spaces and Serre's method. The Adams spectral sequence. Hopf invariant one theorems. The Adams–Novikov spectral sequence. Tables in low dimensions for $p = 3$.

3. The Adams–Novikov E_2 -Term, Formal Group Laws, and the Greek Letter Construction	16
---	----

Formal group laws and Quillen's theorem. The Adams–Novikov E_2 -term as group cohomology. Alphas, betas, and gammas. The Morava–Landweber theorem and higher Greek letters. Generalized Greek letter elements.

4. More Formal Group Law Theory, *BP*-Theory,
Morava's Point of View, and the Chromatic Spectral Sequence 23

The Brown–Peterson spectrum. Classification of formal group laws. Morava's group action, its orbits and stabilizer groups. The chromatic resolution and chromatic spectral sequence. Bockstein spectral sequences. Use of cyclic subgroups to detect Arf invariant elements. Morava's vanishing theorem. Greek letter elements in the chromatic spectral sequence.

5. Unstable Homotopy Groups and the EHP Spectral Sequence 29

The EHP sequences. The EHP spectral sequence. The stable zone. The inductive method. The stable EHP spectral sequence. The Adams vector field theorem. James periodicity. The J -spectrum. The spectral sequence for $J_*(\mathbf{R}P^\infty)$ and $J_*(B\Sigma_p)$. Relation to the Segal conjecture. The Mahowald invariant.

Chapter 2. Setting Up the Adams Spectral Sequence

1. The Classical Adams Spectral Sequence 48

$\text{Mod}(p)$ Eilenberg–Mac Lane spectra. $\text{Mod}(p)$ Adams resolutions. Exact couples. The $\text{mod}(p)$ Adams spectral sequence. Differentials. Homotopy inverse limits. Convergence. The extension problem. Examples: integral and $\text{mod}(p^i)$ Eilenberg–Mac Lane spectra.

2. The Adams Spectral Sequence Based
on a Generalized Homology Theory 57

E_* -Adams resolutions. E -completions. The E_* -Adams spectral sequence. Assumptions on the spectrum E . $E_*(E)$ is a Hopf algebroid. The canonical Adams resolution. Convergence. The Adams filtration.

3. The Smash Product Pairing and
the Generalized Connecting Homomorphism 62

The smash product induces a pairing in the Adams spectral sequence. A map that is trivial in homology induces a map of spectral sequences which raises filtration. The relation between the connecting homomorphism in Ext and the boundary map in homotopy.

Chapter 3. The Classical Adams Spectral Sequence

1. The Steenrod Algebra and Some Easy Calculations 69

Milnor's structure theorem for A_* . The cobar complex. Multiplication by p in the E^∞ -term. The ASS for $\pi_*(MU)$. Computations for MO , bu , and bo .

2. The May Spectral Sequence 79
 May's filtration of A_* . Nonassociativity of May's E_1 -term at odd primes and a modification of his SS that avoids this problem. Computations at $p = 2$ in dimensions ≤ 13 . Computations with the subalgebra $A(2)$ at $p = 2$.
3. The Lambda Algebra 90
 Λ as an Adams E_1 -term. The algebraic EHP spectral sequence. Serial numbers. The Curtis algorithm. Computations below dimension 14. James periodicity. The Adams vanishing line. d_1 is multiplication by λ_{-1} . Illustration for S^3 .
4. Some General Properties of Ext 100
 Ext^s for $s \leq 3$. Behavior of elements in Ext^2 : results of Browder, Mahowald, Ravenel, and Cohen and Goerss. Adams vanishing line (slope $\frac{1}{2}$ for $p = 2$). Periodicity near the vanishing line (above the $\frac{1}{2}$ line for $p = 2$). Elements not annihilated by any iterated periodicity operator and their relation to $\text{im } J$. An elementary proof that most of these elements are nontrivial.
5. Survey and Further Reading 110
 Exotic cobordism theories. Decreasing filtrations of A_* and the resulting spectral sequences. Application to MSP . Mahowald's generalizations of Λ . v_n -periodicity in the ASS. Selected references to related work.
- Chapter 4. BP -Theory and the Adams–Novikov Spectral Sequence**
1. Quillen's Theorem and the Structure of $BP_*(BP)$ 119
 Complex cobordism. Complex orientation of a ring spectrum. The formal group law associated to an oriented homology theory. Quillen's theorem equating the Lazard and complex cobordism rings. Landweber and Novikov's theorem on the structure of $MU_*(MU)$. The Brown–Peterson spectrum BP . Quillen's idempotent operation and p -typical formal group laws. The structure of $BP_*(BP)$.
2. A Survey of BP -Theory 129
 Bordism groups of spaces. The Sullivan–Baas construction. The Johnson–Wilson spectra $BP(n)$. The Morava K -theories $K(n)$. The Landweber filtration and exact functor theorems. The Conner–Floyd isomorphism. K -theory as a functor of complex cobordism. Johnson and Yosimura's work on invariant regular ideals. Infinite loop spaces associated with MU and BP ; Ravenel and Wilson's Hopf ring. The unstable ANSS of Bendersky, Curtis, and Miller.
3. Some Calculations in $BP_*(BP)$ 137
 The Morava–Landweber invariant prime ideal theorem. Some invariant regular ideals. A generalization of Witt's lemma. A formula for the universal p -typical

formal group law. Formulas for the coproduct and conjugation in $BP_*(BP)$. A filtration of $BP_*(BP)/I_n$ and the structure of the associated bigraded object.

4. Beginning Calculations with the Adams–Novikov Spectral Sequence 150

The ANSS and sparseness. The algebraic Novikov SS of Novikov and Miller. Low dimensional Ext over the algebra of Steenrod reduced powers. Bockstein spectral sequences leading to the ANSS E_2 -term. Calculations at odd primes. Toda's theorem on the first nontrivial odd primary Novikov differential. Tables for $p = 5$. Calculations and tables for $p = 2$. Comparison with the Adams spectral sequence.

Chapter 5. The Chromatic Spectral Sequence

1. The Algebraic Construction 172

Greek letter elements and generalizations. The chromatic resolution, spectral sequence, and cobar complex. The Morava stabilizer algebra $\Sigma(n)$. The change of rings theorem. The Morava vanishing theorem. Signs of Greek letter elements. Computations with β_i . Decomposability of γ_1 . Chromatic differentials at $p = 2$. Divisibility of $\alpha_1\beta_p$.

2. $\text{Ext}^1(BP_*/I_n)$ and Hopf Invariant One 184

$\text{Ext}^0(BP_*)$. $\text{Ext}(M^0)$. $\text{Ext}^1(BP_*)$. Hopf invariant one elements. The Miller–Wilson calculation of $\text{Ext}^1(BP_*/I_n)$.

3. $\text{Ext}(M^1)$ and the J -Homomorphism 192

$\text{Ext}(M^1)$. Relation to $\text{im } J$. Patterns of differentials at $p = 2$. Computations with the mod (2) Moore spectrum.

4. Ext^2 and the Thom Reduction 201

Results of Miller, Ravenel, and Wilson ($p > 2$) and Shimomura ($p = 2$) on $\text{Ext}^2(BP_*)$. Behavior of the Thom reduction map. Arf invariant differentials at $p > 2$. Results of Mahowald and those of Cohen and Goerss.

5. Periodic Families in Ext^2 208

Smith construction of β_i . Obstructions at $p = 3$. Results of Davis and Mahowald, Oka, Smith, and Zahler on permanent cycles in Ext^2 . Decomposables in Ext^2 .

6. Elements in Ext^3 and Beyond 215

Products of alphas and betas in Ext^3 . Products of betas in Ext^4 . A possible obstruction to the existence of $V(4)$.

Chapter 6. Morava Stabilizer Algebras

1. The Change-of-Rings Isomorphism 220
Theorems of Miller and Ravenel; theorems of Morava. General nonsense about Hopf algebroids. Formal group laws over Artin local rings. Morava's proof. Miller and Ravenel's proof.
2. The Structure of $\Sigma(n)$ 226
Relation to the group ring for S_n . Recovering the grading via an eigenspace decomposition. A matrix representation of S_n . A splitting of S_n when $p \nmid n$. Poincaré duality and periodic cohomology of S_n .
3. The Cohomology of $\Sigma(n)$ 231
A May filtration of $\Sigma(n)$ and the May SS. The open subgroup theorem. Cohomology of some associated Lie algebras. H^1 and H^2 . $H_*((S(n)))$ for $n = 1, 2, 3$.
4. The Odd Primary Kervaire Invariant Elements 244
The nonexistence of certain elements and spectra. Detecting elements with the cohomology of $\mathbb{Z}/(p)$. Differentials in the ASS.
5. The Spectra $T(n)$ 253
A splitting theorem for certain Thom spectra. Application of the open subgroup theorem. Ext^0 and Ext^1 .

Chapter 7. Computing Stable Homotopy Groups with the Adams–Novikov Spectral Sequence

1. The Method of Infinite Descent 258
Some Hopf algebroids and extensions. An alternative to the Cartan–Eilenberg spectral sequence. Weak injective comodules. Some useful cochain complexes.
2. The Complex $C_{1,1}$ 262
Poincaré series and weak injectives. The structure of $C_{1,1}$.
3. The Homotopy Groups of a Complex with p Cells 268
Quillen operations and Ext^0 . A useful SES (7.3.5). Another SS (7.3.8). Differentials (7.3.11). A paradigmatic SS involving $P(1)$.

4. The “Algorithm” and Computations at $p = 3$ 281

The SS for extracting $\pi_*(S^0)$ from $\pi_*(X)$. The ABC Theorem for $\pi_*(X)$. Table showing ABC at $p = 5$. A computational procedure. The input for $p = 3$. The output through dimension 106.

5. Computations for $p = 5$ 289

$d_{33}(\gamma_3) = \beta_1^{18}$ at $p = 5$ and $V(3)$ does not exist. A conjecture for larger primes. The input for $p = 5$. Computing the output.

Appendix 1. Hopf Algebras and Hopf Algebroids

1. Basic Definitions 309

Hopf algebroids as cogroupoid objects in the category of commutative algebras. Comodules. Cotensor products. Maps of Hopf algebroids. The associated Hopf algebra. Normal maps. Unicursal Hopf algebroids. The kernel of a normal map. Hopf algebroid extensions. The comodule algebra structure theorem. Invariant ideals. Split Hopf algebroids.

2. Homological Algebra 319

Injective comodules. The derived functors Cotor and Ext. Relative injectives and resolutions of same. The cobar resolution and complex. Cup products. Ext isomorphisms for invariant ideals and split Hopf algebroids.

3. Some Spectral Sequences 325

The SS derived from an LES. Filtered Hopf algebroids. Filtration by powers of the unit coideal. The SS associated with a Hopf algebroid map. Change of rings isomorphism. The Cartan–Eilenberg SS. A formulation due to Adams. The E_2 -term for a cocentral extension of Hopf algebras.

4. Massey Products 335

Definitions of n -fold matrix Massey products and indeterminacy. Defining systems. Juggling theorems (associativity and commutativity formulas). Convergence of Massey products in spectral sequences. A Leibnitz formula for differentials. Differentials and extensions in spectral sequences.

5. Algebraic Steenrod Operations 346

Construction, Cartan formula, and Adem relations. Commutativity with suspension. Kudo transgression theorem.

Appendix 2. Formal Group Laws**1. Universal Formal Group Laws and Strict Isomorphisms** 355

Definition and examples of formal group laws. Homomorphisms, isomorphisms, and logarithms. The universal formal group law and the Lazard ring. Lazard's comparison lemma. The Hopf algebroid V/T . Proof of the comparison lemma.

2. Classification and Endomorphism Rings 369

Hazewinkel's and Araki's generators. The right unit formula. The height of a formal group law. Classification in characteristic p . Finite fields, Witt rings, and division algebras. The endomorphism ring of height n formal group law.

Appendix 3. Tables of Homotopy Groups of Spheres 380**References** 395***Index*** 407
