

I Algebraic Preliminaries 1

1. Tensor products of vector spaces	2
2. The tensor algebra of a vector space	5
3. The contravariant and symmetric algebras	10
4. Exterior algebra	14
5. Exterior equations	24

II Differentiable Manifolds 31

1. Definitions	32
2. Differential maps	39
3. Sard's theorem	45
4. Partitions of unity, approximation theorems	55
5. The tangent space	69
6. The principal bundle	73
7. The tensor bundles	84
8. Vector fields and Lie derivatives	89

1. The operator d	99
2. Chains and integration	104
3. Integration of densities	111
4. 0 and n -dimensional cohomology, degree	120
5. Frobenius' theorem	130
6. Darboux's theorem	137
7. Hamiltonian structures	141

IV **The Calculus of Variations**

1. Legendre transformations	150
2. Necessary conditions	153
3. Conservation laws	170
4. Sufficient conditions	174
5. Conjugate and focal points, Jacobi's condition	182
6. The Riemannian case	199
7. Completeness	207
8. Isometries	212

V **Lie Groups**

1. Definitions	214
2. The invariant forms and the Lie algebra	217
3. Normal coordinates, exponential map	222
4. Closed subgroups	228
5. Invariant metrics	231
6. Forms with values in a vector space	234

1. The equations of structure of Euclidean space	237
2. The equations of structure of a submanifold	244
3. The equations of structure of a Riemann manifold	246
4. Curves in Euclidean space	252
5. The second fundamental form	264
6. Surfaces	279

VII **The Geometry of G-Structures**

293

1. Principal and associated bundles, connections	294
2. G-structures	309
3. Prolongations	331
4. Structures of finite type	339
5. Connections on G-structures	351
6. The spray of a linear connection	361

APPENDIX I **Two Existence Theorems**

369

APPENDIX II **Outline of Theory of Integration on E^n**

374

APPENDIX III **An Algebraic Model of Transitive Differential Geometry**

384

APPENDIX IV **The Integrability Problem for Geometrical Structures**

417
