<i>Preface</i>		
1 Vector algebra revisited		1
1.1 Prerequisites		1
Problems 1A		4
1.2 Vectors and scalars		6
1.3 Addition of vectors		6
1.4 The essential nature of vectors; ‘cosine-quality’		7
1.5 Localisation of vectors		8
1.6 Scalar and vector fields		8
1.7 Vector area		9
1.8 Vector flow intensity		10
1.9 Vector multiplication		12
1.10 Scalar products		12
1.11 Vector products		13
1.12 Multiple products of vectors		14
Problems 1B		15
2 Vector algebra applied to electromagnetism		17
2.1 The fundamental forces on charged particles		17
2.2 Continuous media, conductors and dielectrics		20
2.3 Current flow		20
2.4 Body forces		21
2.5 Moving media		23
2.6 Ohm’s law		24
2.7 Magnetisation		25
Problems 2		25
3 Line and surface integrals		29
3.1 The prerequisite knowledge for later chapters		29
Problems 3A		31
3.2 Applied vector field theory – an introduction		32
3.3 Line integrals		33
3.4 Closed line integrals, circulation and conservative fields		36
3.5 Potential		37
3.6 Applications to electrostatics and other central force fields		38
3.7 Applications to magnetism		40
3.8 Surface integrals		43
3.9 Closed surfaces		45

Contents

3.10 Applications to fluid mechanics	46
*3.11 The addition of area elements	47
3.12 The flux integral $\iint \mathbf{v} \cdot d\mathbf{a}$	49
3.13 Closed surfaces and solenoidal fields	50
3.14 Vector field lines	52
3.15 Vector field tubes	54
3.16 Solenoidal field tubes	54
3.17 Flux-linkage	56
Problems 3B	56
4 Further applications to electromagnetism	62
4.1 Ampère's law	62
*4.2 Ampère's law and the Biot–Savart law	63
4.3 Multi-valued potentials; magnetic potential	64
4.4 Ampère's law and Kirchhoff's first law	69
4.5 Faraday's law	70
4.6 The lumped-component approximation	73
4.7 Kirchhoff's second law; electromotive force	74
4.8 Faraday's law for a moving loop	76
Problems 4	79
5 Volume integrals	83
5.1 Triple integrals	83
5.2 The evaluation of volume integrals	84
5.3 An important application of volume and surface integrals	88
5.4 Gauss's law	88
5.5 Gauss's law and dielectric media	89
5.6 Plasma oscillation	91
5.7 Conservation statements	93
5.8 Two-dimensional problems	95
Problems 5	97
6 A crisis in electromagnetic theory	102
6.1 Another look at the Kirchhoff and Ampère laws	102
6.2 Maxwell's resolution of the difficulty	104
6.3 Dielectrics and 'displacement' current	107
*6.4 The Biot–Savart and Maxwell–Ampère laws	107
6.5 Material magnetisation	108
6.6 Different kinds of magnetisation	111
6.7 The comparison with polarisation	113
6.8 A summary of the equations of electromagnetism in integral form	113
*6.9 Electromagnetic boundary conditions	115
Problems 6	118

Note. An asterisk denotes a section which is more difficult, and which can be omitted without detriment to the understanding of the following sections.

Contents

7	Gradient and divergence, gauges of non-uniformity	123
7.1	The differential approach	123
7.2	The influence of fluid pressure	123
7.3	Vector gradient	125
7.4	Hydrostatics	128
7.5	Magneto-hydrostatics	129
7.6	Grad and potential	130
7.7	Flux/gradient laws	132
7.8	The divergence operator	136
7.9	Flux conservation statements	138
7.10	An important vector identity	139
7.11	Gauss's theorem	140
7.12	A corollary to Gauss's theorem; the gradient theorem	143
	Problems 7	144
8	Gradient and divergence combined	149
8.1	The laplacian operator	149
8.2	Stream function for two-dimensional, solenoidal fields	150
8.3	Laplace's equation	154
8.4	Analogue methods	155
8.5	Mathematical methods	155
8.6	Fourier's great contribution	158
8.7	Laplace's equation in two dimensions	158
8.8	Curvilinear squares	159
*8.9	The ϕ, ψ duality	162
8.10	A particular two-dimensional case	164
*8.11	Complex variable methods	165
	Problems 8	167
9	Four other important partial differential equations	173
9.1	Fields with divergence	173
9.2	Poisson's equation	173
9.3	Helmholtz's equation: criticality	178
9.4	The unsteady diffusion equation	181
9.5	Inertial fluid mechanics: the D/Dt and $(\mathbf{v} \cdot \text{grad})$ operators	184
9.6	Perturbations in a compressible fluid; the scalar wave equation	187
9.7	The one-dimensional wave equation	189
9.8	Wave reflection and standing waves	190
9.9	Summary of the main ideas of chapters 7, 8 and 9	195
	Problems 9	195
10	Rotationality and the curl operator in fluid mechanics	204
10.1	General fluid mechanics	204
10.2	Vorticity, the key to fluid dynamics	204
10.3	The three-dimensional case; the curl operator	206
10.4	Some simple flows	208

Contents

*10.5	A derivation of vorticity in three dimensions	210
10.6	Some important vector identities	212
10.7	An application to fluid mechanics; irrotational flow with uniform density	215
10.8	Irrotationality and potential	218
10.9	Curl and circulation	221
10.10	Stokes's theorem	224
*10.11	Some more mathematical results	226
	Problems 10	228
11	The curl operator in electromagnetism	237
11.1	The electromagnetic equations in differential form	237
11.2	Electromagnetic skin-effect; shielding	240
11.3	Alternating-current skin-effect	243
11.4	Magnetic pressure and levitation	245
11.5	Electromagnetic waves	245
11.6	Sinusoidal waves	249
11.7	Electromagnetic waves and charge motions in circuits	251
*11.8	Energy in electromagnetism	256
*11.9	Applications of Poynting flux	258
*11.10	Some more mathematical points	261
	Problems 11	262
12	Integrals in fluid mechanics	272
12.1	Line, surface and volume integrals	272
12.2	Rotation in fluids	272
12.3	Circulation round a travelling loop	273
12.4	Kelvin's theorem in constant-density flow	275
*12.5	The case of variable density	276
12.6	Helmholtz's theorem	279
12.7	Vorticity convection	280
12.8	Secondary flow	282
12.9	Two-dimensional, constant-density flows	283
12.10	The momentum flux integral	285
12.11	Circulation in irrotational flow	288
12.12	The circulation-lift theorem	291
12.13	Flow past wings of finite span	293
12.14	A final valediction	296
	Problems 12	297
	<i>Appendix I: A note on differentials, Taylor's theorem and mathematical modelling</i>	304
	<i>Appendix II: Suggested lecture demonstrations and coursework tasks</i>	311
	<i>Answers to problems</i>	317
	<i>Index</i>	325
