

# CONTENTS

<i>Chap. I.</i> General Introduction . . . . .	<i>page</i> 1
Axioms and definitions. Classes and relations. Linear order. The natural numbers. Generation of real numbers. Continuity. Axioms for magnitudes, groups, quasi-fields and fields. Non-Archimedean systems. Complex numbers. Modular fields. Linear equations.	
<i>Chap. II.</i> Order . . . . .	42
Axioms of order. Definitions of line, plane, space. Their fundamental properties.	
<i>Chap. III.</i> Further Theorems on Order. . . . .	66
Angles. Senses for lines and angles. Inside and outside of angles. Dihedral and trihedral angles.	
<i>Chap. IV.</i> The Axioms of Congruence . . . . .	87
Congruence of lines, intervals, angles, triangles and crosses. The measures of intervals and angles. Congruence of dihedral and trihedral angles.	
<i>Chap. V.</i> The Circle Axioms. . . . .	127
Their relations to the congruence Axioms. The reduction of the latter. Tangents to circles and spheres.	
<i>Chap. VI.</i> The Parallel Axioms . . . . .	138
Their relations to the congruence Axioms. Applications. Pappus' and Desargues' Theorems. Projective and Euclidean Geometry. Ideal entities.	
<i>Chap. VII.</i> Proportion and the Algebra of Intervals . . . . .	166
Geometric proportion. Similar triangles. The multiplication of the measures of intervals. Applications. The inversion plane. Radical axes.	
<i>Chap. VIII.</i> Desargues' and Pappus' Theorems and the Introduction of Congruence by Definition. . . . .	186
Algebra of points. Coordinate geometry independent of congruence. Independence questions for Pappus' and Desargues' Theorems. The Argand diagram. Independence of the parallel Axioms. Hessenberg's Theorem.	

<i>Chap. IX.</i> Constructions . . . . .	<i>page</i> 216
Gauge constructions. Poncelet-Steiner Theorem. Mascheroni's Theorem. Relations between the parallel Axioms and the circle Axioms. The Gaussian theory of the regular polygons.	
<i>Chap. X.</i> The Analysis Situs of Plane Polygons . . . . .	236
On the basis of the order Axioms only: Inside and outside of polygons. Their dissection. Their intersections. Euler's Theorem.	
<i>Chap. XI.</i> The Areas of Polygons . . . . .	256
Equivalence, equivalence by addition. Measures of polygons. Equivalence and identity of measure. The influence of Archimedes' Axiom.	
<i>Chap. XII.</i> The Volumes of Polyhedra . . . . .	272
Lennes' definition of polyhedra. Their inside and outside. Their dissection. Their volumes. Dehn's Theorem. Suss' Theorems. Regular polyhedra.	
<i>Chap. XIII.</i> Continuity . . . . .	296
Existence of parallels. Weakening of parallel Axioms. Two sufficient bases for Euclidean Geometry, one with congruence introduced by definition, one with congruence as undefined. Consistency and completeness.	
<i>Chap. XIV.</i> Congruence as the Sole Undefined Relation between Points . . . . .	310
Definitions of lines and planes. Reflections. Rotations. Isomerics. Euclidean motions. Screws.	
<i>Chap. XV.</i> The Angle-Sum of a Triangle and Non- Euclidean Areas . . . . .	330
Geometry on a sphere. Theorem of Saccheri-Legendre. The influence of Archimedes' Axiom. Equivalence and identity of measure for non-Euclidean Areas. The Axiom of similarity. Literature.	
List of Geometric Axioms employed . . . . .	345
List of Constructions . . . . .	345
List of Symbols in frequent use . . . . .	346
Index . . . . .	347
