

CONTENTS

PREFACE	VII
INTRODUCTION	1
The nature of numbers. Arithmetic and the game of chess. Definition of counting. Evolution of the concept of a formal system.	
CHAPTER I	13
The arithmetical operations. Definition by iteration and recursion. Contracted notation. Single and multiple recursions.	
EXAMPLES I	25
CHAPTER II	27
Definition of proof. Commutative and associative properties of addition. The equations	
$x + (y \div x) = y + (x \div y)$ and $(1 \div x,y)f(x) = (1 \div x,y)f(y)$.	
The functions Σ , Π , and μ . Inequalities. Verifiability and freedom from contradiction.	
EXAMPLES II	51
CHAPTER III	56
The propositional calculus. Propositional functions. The limited universal, existential and minimal operators A_{Σ}^n , E_{Σ}^n , and L_{Σ}^n . Mathematical induction. The counting operator N_{Σ}^n .	
EXAMPLES III	80
CHAPTER IV	86
The fundamental theorems of arithmetic. Prime numbers. Uniqueness of the resolution into prime factors. The greatest common factor.	
EXAMPLES IV.	101
CHAPTER V	104
Formalisations of recursive arithmetic. The Deduction Theorem. Reduction of the uniqueness schema.	
CHAPTER VI	119
Reductions to primitive recursion. Course-of-values recursion. Recursion with parameter substitution. Simultaneous recursions. Generalised induction schemata. Permutation.	

CHAPTER VII	134
Elimination of parameters. The initial functions and the generation of all primitive recursive functions by the single schema $Fx = A^*0$. The enumerating function. A doubly recursive function which cannot be defined by primitive recursion and substitution alone.	
CHAPTER VIII	143
Gödel numbering and the incompleteness of arithmetic. The arithmetisation of syntax. The construction of a verifiable unprovable equation. Skolem's non-standard model for arithmetic.	
SOLUTIONS TO EXAMPLES	157
